Limitations

AECOM Infrastructure and Environment UK Limited ("AECOM") has prepared this Report for the sole use of Lewes District Council ("Client") in accordance with the terms and conditions of appointment dated 21/09/17. No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by AECOM. This Report may not be relied upon by any other party without the prior and express written agreement of AECOM.

Where any conclusions and recommendations contained in this Report are based upon information provided by others, it has been assumed that all relevant information has been provided by those parties and that such information is accurate. Any such information obtained by AECOM has not been independently verified by AECOM, unless otherwise stated in the Report. AECOM accepts no liability for any inaccurate conclusions, assumptions or actions taken resulting from any inaccurate information supplied to AECOM from others.

The methodology adopted and the sources of information used by AECOM in providing its services are outlined in this Report. The work described in this Report was undertaken in July and August 2018 and is based on the conditions encountered and the information available during the said period of time. The scope of this Report and the services are accordingly factually limited by these circumstances. AECOM disclaim any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to AECOM's attention after the date of the Report.

1. Introduction

Scope of the Project

1.1 AECOM was appointed by Lewes District Council to assist in undertaking a Habitats Regulations Assessment (HRA) of Lewes District Council's Local Plan Part 2 (LPP2) and Neighbourhood Plans, which allocate specific sites suitable for development in order to meet the Joint Core Strategy[1] requirements for quantum of housing and employment to the end of the Plan period (2030). As such LPP2 relates to those parts of Lewes District that lie outside the South Downs National Park. In addition to site allocations LPP2 includes Development Management (DM) policies.

1.2 The Joint Core Strategy was subject to HRA prior to its adoption and a conclusion of no adverse effect on the integrity of any European sites was reached. A further analysis was undertaken in summer 2017 (**Appendix B** for information) with specific regard to the potential for traffic-related air quality effects on Ashdown Forest SAC to arise from the Joint Core Strategy (including growth expected in Local Plan Part 2) and South Downs Local Plan 'in combination' with other plans and projects. This was undertaken to fill a gap in the HRA of the adopted Joint Core Strategy that was identified in a High Court judgment of April 2017.

1.3 The various Joint Core Strategy HRAs and air quality modelling analyses therefore address the strategic effect of growth across Lewes District. Those strategic issues therefore do not require reinvestigating for Local Plan Part 2. The objective of this HRA is to identify if any particular site allocations and DM policies have the potential to cause an adverse effect on Natura 2000 or European designated sites (Special Areas of Conservation, SACs, Special Protection Areas, SPAs, and Ramsar sites designated under the Ramsar convention), either in isolation or in combination with other plans and projects, and to determine whether site-specific mitigation measures are required.

Legislation

1.4 The need for HRA is set out within Article 6 of the EC Habitats Directive 1992, and interpreted into British law by the Conservation of Habitats & Species Regulations 2017. The ultimate aim of the Habitats Directive is to "*maintain or restore, at favourable conservation status, natural habitats and species of wild fauna and flora of Community interest*" (Habitats Directive, Article 2(2)). This aim relates to habitats and species, not the European sites themselves, although the sites have a significant role in delivering favourable conservation status. European sites (also called Natura 2000 sites) can be defined as actual or proposed/candidate Special Areas of Conservation (SAC) or Special Protection Areas (SPA). It is also Government policy for sites designated under the Convention on Wetlands of International Importance (Ramsar sites) to be treated as having equivalent status to Natura 2000 sites.

1.5 The Habitats Directive applies the precautionary principle to protected areas. Plans and projects can only be permitted having ascertained that there will be no adverse effect on the integrity of the site(s) in question. This is in contrast to the SEA Directive which does not prescribe how plan or programme proponents should respond to the findings of an environmental assessment; merely that the assessment findings (as documented in the 'environmental report') should be 'taken into account' during preparation of the plan or programme. In the case of the Habitats Directive, plans and projects may still be permitted if there are no alternatives to them and there are Imperative Reasons of Overriding Public Interest (IROPI) as to why they should go ahead. In such cases, compensation would be necessary to ensure the overall integrity of the site network.

1.6 All the European sites mentioned in this document are shown in **Appendix A, Figure A1.** In order to ascertain whether or not site integrity will be affected, a HRA should be undertaken of the plan or project in question.

[1] Core Strategy (Local Plan Part 1) Adopted Joint Core Strategy 2016 http://www.lewes.gov.uk/corestrategy/ [accessed 03/10/2017]

Habitats Directive 1992

Article 6 (3) states that:

"*Any plan of project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives."*

Conservation of Habitats and Species Regulations 2017

Regulation 63 states that:

"*A competent authority, before deciding to … give any consent for a plan or project which is likely to have a significant effect on a European site … must make an appropriate assessment of the implications for the plan or project in view of that site's conservation objectives… The competent authority may agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the European site."*

Box 1: The legislative basis for HRA

1.7 Over the years, 'Habitats Regulations Assessment' (HRA) has come into wide currency to describe the overall process set out in the Habitats Regulations, from screening through to identification of IROPI. This has arisen in order to distinguish the overall process from the individual stage of "Appropriate Assessment". Throughout this Report the term HRA is used for the overall process and restricts the use of Appropriate Assessment to the specific stage of that name.

2. Methodology

Introduction

2.1 This section sets out the approach and methodology for undertaking the HRA. HRA itself operates independently from the Planning Policy system, being a legal requirement of a discrete Statutory Instrument. Therefore there is no direct relationship to the 'Test of Soundness'.

2.2 The HRA is being carried out in the absence of formal Government guidance. The Department for Communities and Local Government (DCLG) released a consultation paper on Appropriate Assessment (AA) of Plans in 2006[2]. As yet, no further formal guidance has emerged. However, Court Judgements can be used to shape the approaches used.

2.3 The draft DCLG guidance[3] makes it clear that when implementing HRA of land-use plans, the AA should be undertaken at a level of detail that is appropriate and proportional to the level of detail provided within the plan itself: "The comprehensiveness of the [Appropriate] assessment work undertaken should be proportionate to the geographical scope of the option and the nature and extent of any effects identified. An AA need not be done in any more detail, or using more resources, than is useful for its purpose. It would be inappropriate and impracticable to assess the effects [of a strategic land use plan] in the degree of detail that would normally be required for the Environmental Impact Assessment (EIA) of a project." More recently, the Court of Appeal[4] ruled that providing the Council (competent authority) was duly satisfied that proposed mitigation could be 'achieved in practice' to avoid an adverse effect, then this would suffice. This ruling has since been applied to a planning permission (rather than a Core Strategy)[5]. In this case the High Court ruled that for 'a multistage process, so long as there is sufficient information at any particular stage to enable the authority to be satisfied that the proposed mitigation can be achieved in practice it is not necessary for all matters concerning mitigation to be fully resolved before a decision maker is able to conclude that a development will satisfy the requirements of reg. 61 of the Habitats Regulations'.

2.4 In other words, there is a tacit acceptance that Appropriate Assessment can be tiered and that all impacts are not necessarily appropriate for consideration to the same degree of detail at all tiers.

2.5 **Figure 1** below outlines the stages of HRA according to current draft CLG guidance. The stages are essentially iterative, being revisited as necessary in response to more detailed information, recommendations and any relevant changes to the plan until no significant adverse effects remain.

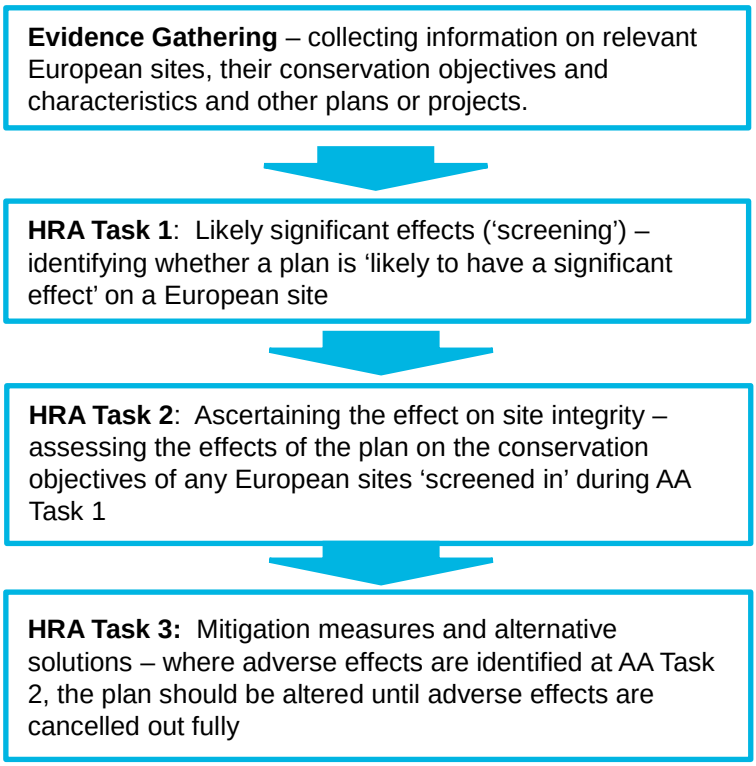

Figure 1: Four-Stage Approach to Habitats Regulations Assessment (Source: CLG, 2006)

Likely Significant Effects (LSE)

2.6 The first stage of any Habitats Regulations Assessment (HRA Task 1) is a Likely Significant Effect (LSE) test - essentially a risk assessment to decide whether the full subsequent stage known as Appropriate Assessment is required. The essential question is:

2.7 "Is the Plan, either alone or in combination with other relevant projects and plans, likely to result in a significant effect upon European sites?"

2.8 The objective is to 'screen out' those plans and projects that can, without any detailed appraisal, be said to be unlikely to result in significant adverse effects upon European sites, usually because there is no mechanism for an adverse interaction with European sites. The Likely Significant Effect test is the purpose of this HRA report.

2.9 This report is essentially an accompanying document of the Lewes District Council Joint Core Strategy (Local Plan Part 1) HRA[6]. That previous document and its 2017 Addendum (**Appendix B** for reference) undertook a strategic assessment 'in combination' of all housing and other development planned for the Lewes district, regarding recreational pressure, air quality, water quality and quantity and other impact pathways. Lewes District Council's LPP2 does not seek to deviate from the Joint Core Strategy in terms of the overall quantum and distribution of housing. Rather, this document identifies specific locations (other than those strategic allocations noted in Table 1) where new development will be delivered.

2.10 The purpose of this HRA is therefore very specific. Its primary focus is to examine each preferred site allocation in order to determine whether it would present any potential for site-specific impacts that could not have been identified during the strategic HRA. This HRA also examines Development Management (DM) policies.

HRA Task 2 – Appropriate Assessment (AA)

2.11 Where it is determined that a conclusion of 'no likely significant effect' cannot be drawn, particularly regarding the need to consider mitigation, the analysis has proceeded to the next

[6] Lewes District Council & The South Downs National Park Authority. Lewes District Core Strategy: Proposed Submission Stage (Regulation 20) Habitat Regulations Assessment Report (Stages 1 – 3) (2013). http://www.lewes.gov.uk/planning/20408.asp [accessed 03/10/2017]

stage of HRA known as Appropriate Assessment. Case law has clarified that 'appropriate assessment' is not a technical term. In other words, there are no particular technical analyses, or level of technical analysis, that are classified by law as belonging to appropriate assessment rather than determination of likely significant effects.

2.12 One of the key considerations during appropriate assessment is whether there is available mitigation that would entirely address the potential effect. In practice, the appropriate assessment takes any policies or allocations that could not be dismissed following the high-level Screening analysis and analyse the potential for an effect in more detail, with a view to concluding whether there would actually be an adverse effect on integrity (in other words, disruption of the coherent structure and function of the European site(s)).

2.13 There has been a decision by the European Court of Justice[7], which appears to conclude that measures intended to avoid or reduce the harmful effects of a proposed project on a European site, but which are not an integral part of the project or plan, may no longer be taken into account by competent authorities at the Likely Significant Effects or 'screening' stage of HRA. The implications of the ECJ ruling are that the role of avoidance and measures should be discussed in the 'appropriate assessment' stage instead.

HRA Task 3 – Avoidance and Mitigation

2.14 Where necessary, measures are recommended for incorporation into the Plan in order to avoid or mitigate adverse effects on European sites. There is considerable precedent concerning the level of detail that a Local Plan document needs to contain regarding mitigation for recreational impacts on European sites. The implication of this precedent is that it is not necessary for all measures that will be deployed to be fully developed prior to adoption of the Plan, but the Plan must provide an adequate policy framework within which these measures can be delivered.

2.15 In evaluating significance, AECOM has relied on professional judgement as well as the results of previous stakeholder consultation regarding development impacts on the European sites considered within this assessment.

2.16 When discussing 'mitigation' for a Local Plan document, one is concerned primarily with the policy framework to enable the delivery of such mitigation rather than the details of the mitigation measures themselves since the Local Plan document is a high-level policy document.

Confirming Other Plans and Projects That May Act 'In combination'

2.17 The Conservation of Habitats and Species Regulations (2017) require that plans are not considered purely in isolation but 'in combination' with other projects and plans. That analysis has already been undertaken as part of the strategic HRA undertaken for the Lewes Joint Core Strategy[8] and Addendum[9]. However since this time neighbouring Authorities have progressed their own strategic planning policy as follows:

- Brighton and Hove City Plan Part One (Adopted March 2016) and emerging City Plan Part 2
- South Downs Local Plan (submitted spring 2017)
- Mid Sussex District Plan (adopted March 2018)

2.18 Other Plans considered for the in combination assessment include:

- Wealden District Council Core Strategy Local Plan (adopted 2013, new Local Plan out to consultation);
- Tunbridge Wells Borough Local Development Framework. Core Strategy Development Plan Document (adopted 2010);

[7] People Over Wind and Sweetman v Coillte Teoranta (C-323/17)
[8] Proposed Modifications Version August 2015 http://www.lewes.gov.uk/Files/plan_Core_Strategy_-_Track_Changes_Modifications_Illustrative_Aug_2015.pdf
[9] AECOM (2017). South Downs National Park Authority Local Plan/Lewes Joint Core Strategy Habitats Regulations Assessment. Addendum: Traffic-Related Effects on Ashdown Forest SAC

- Sevenoaks District Council Core Strategy Development Plan Document (adopted 2011, new Local Plan out to consultation);
- Tandridge District Core Strategy (adopted 2008, new Local Plan in preparation);
- Crawley 2030: Crawley Borough Local Plan 2015 – 2030;
- Rother District Council Core Strategy (adopted 2014);
- Horsham District Council District Planning Framework (excluding South Downs National Park);
- Reigate and Banstead Borough Council Core Strategy (adopted 2014); and,
- East Sussex Local Transport Plan 3, 2011 to 2026.
- Eastbourne Borough Council Core Strategy Local Plan (adopted 2013)
- Eastbourne Borough Council Employment Land Local Plan (adopted 2016)

3. Internationally Designated Sites and Summary of the Joint Core Strategy HRA and Subsequent Air Quality Work

3.1 This section outlines the European designated sites located within Lewes District or within 20km of the Lewes District boundary

3.2 There are two internationally designated sites that lie within Lewes District. These are:

- Castle Hill SAC located within Lewes District and Brighton & Hove; and,
- Lewes Downs SAC located entirely within Lewes District.

3.3 A further two internationally designated sites are located within 20km of Lewes District. These are:

- Pevensey Levels Ramsar & SAC located 10.3km east of Lewes District within Wealden District; and,
- Ashdown Forest SPA and SAC located 5.1km north east of Lewes District within Wealden District.

3.4 The locations of these are illustrated in (**Appendix A, Figure A1**).

Castle Hill SAC

3.5 Castle Hill SAC is designated for its[10]:

- Semi-natural dry grasslands and scrubland facies: on calcareous substrates (*Festuco Brometalia*) (important orchid sites). (Dry grasslands and scrublands on chalk or limestone, including important orchid sites); and,
- Early gentian *Gentianella anglica*.

3.6 Relevant environmental factors include:

- Low levels of recreational pressure; low nutrient inputs and no direct fertilisation; appropriate grazing regime; and an absence of leaching and spray-drift of chemicals from surrounding arable land.

3.7 The Joint Core Strategy HRA[11] scoped out any potential likely significant effects upon Castle Hill SAC due to an absence of impact pathways, as has the Brighton & Hove Local Plan Part 2 HRA, more recently. As such it can be scoped out from further consideration and is not discussed further.

Lewes Downs SAC

3.8 Lewes Downs SAC is designated for its[12]:

- Semi-natural dry grasslands and scrubland facies: on calcareous substrates (*Festuco-Brometalia*).

3.9 Relevant environmental factors include:

- Suitable grazing regime; low nutrient inputs and no direct fertilisation; low recreational pressure; and an absence of leaching and spray-drift of chemicals from surrounding arable land.

3.10 The Joint Core Strategy HRA[13] undertook air quality calculations (including consideration in combination with other projects and plans). This concluded no adverse effect upon the integrity

[10] JNCC (2011). Natura 2000. Standard Data Form. Castle Hill SAC. http://jncc.defra.gov.uk/protectedsites/sacselection/n2kforms/UK0012836.pdf [accessed 03/10/2017]
[11] http://www.lewes.gov.uk/planning/20408.asp
[12] JNCC (2011). Natura 2000. Standard Data Form. http://jncc.defra.gov.uk/protectedsites/sacselection/n2kforms/UK0012832.pdf [accessed 03/10/2017]
[13] http://www.lewes.gov.uk/planning/20408.asp

on Lewes Downs SAC would result alone or 'in combination' with other projects and plans, a conclusion that has also been reached in 2017 in the HRA of the South Downs Local Plan using updated calculations. As such Lewes Downs SAC can be screened out from further consideration in this HRA and is not discussed further.

3.11 Two links within 200m of Lewes Downs SAC were modelled in 2015 for the Joint Core Strategy: the A26 and the B2192 (in addition to the junction between the two roads where they both lie within 200m of the SAC)[14]. Although these calculations ran to 2030 (rather than 2033) the scale of expected growth in the Lewes part of the National Park (and Lewes District outside the National Park) by 2030 has not materially changed since these calculations were undertaken and the addition of a further three years will not alter the trends and magnitudes depicted in the modelling. The DS trends shown for 2030 can be expected to continue to 2033. Baseline NOx concentrations within 200m of the B2192 (and at the junction between this road and the A26) are significantly below the critical level being c. 18 - 19 μgm^{-3}. This is partly due to the considerable distance between these links and the SAC (a minimum of 60m) and partly to the relatively low flows on these links. The DN scenario forecast those concentrations to reduce further over the period to 2030. The inclusion of the Joint Core Strategy does not materially retard this improvement (resulting in a maximum difference of 0.1 μgm^{-3} at the closest point of the SAC). NOx concentrations are forecast to remain well below the critical level. As such there is no meaningful difference in nitrogen deposition rates between DN (growth without the plan) and DS (growth with the plan), amounting to a maximum of 0.02 kgN/ha/yr and a substantial improvement in nitrogen deposition rates is forecast due to improvements in background.

3.12 For the A26 baseline NOx concentrations are identified to be well above the critical level at the closest point to the road but these have fallen below the critical level before 50m into the SAC. The DN and DS scenarios both forecast a further lowering of NOx concentrations such that they are anticipated to fall below the critical level before 30m into the SAC by 2030. The DS scenario (including the JCS) retards the expected improvement by 1 μgm^{-3} at the closest point to the road. Since the main role of NOx is as a source of nitrogen, the effect of this retardation on nitrogen deposition rates was also investigated. The calculations project a net improvement in nitrogen deposition by 2030 at the closest point to the SAC of c. 3 kgN/ha/yr, notwithstanding forecast increases in traffic flows from all sources. The DS scenario (including the JCS) retards this improvement very slightly, by a maximum of 0.08 kgN/ha/yr at the closest point to the road. Moreover, the SAC is designated for calcareous grassland and the nearest area of calcareous grassland to the A26 (in the vicinity of Malling Industrial Estate) is approximately 50m from the roadside, with the intervening area being occupied by dense mature woodland. At 50m from the roadside total nitrogen deposition is forecast to have fallen to 14.39 kgN/ha/yr (even allowing for all expected traffic growth, including the contribution of ammonia emissions) by the end of the plan period, which is below the most precautionary part of the critical load range (15 kgN/ha/yr) for calcareous grassland.

3.13 Moreover, the contribution of the JCS/Local Plan to nitrogen deposition at the closest area of calcareous grassland would be a negligible 0.03 kgN/ha/yr. This is effectively zero, since deposition is never reported to more than two decimal places to avoid false precision. It equates to 0.2% of the critical load or a 0.2% change in the deposition rate that would otherwise be expected by 2030 i.e. the difference between an annual average deposition rate of 14.37 KgN/ha/yr and 14.39 KgN/ha/yr. This difference is not ecologically significant, given that no habitats that have been studied to date are responsive to such very small incremental changes in nitrogen deposition (in practice annual variation in background deposition rates is likely to be much greater than this incremental change).

3.14 Modelling undertaken for Wealden District Council to support the HRA of their Local Plan published in August 2018 draws a similar conclusion as the South Downs/Lewes modelling when the most realistic scenario (Scenario B) is examined. A net improvement in nitrogen deposition is forecast when all growth is considered 'in combination' and paragraph 14.53 states that under this scenario *'…concentrations and deposition* [due to additional traffic]*… is not predicted to encroach into the area of calcareous grassland*…' i.e. it will only affect the area of woodland along the A26. The HRA report then acknowledges in paragraph 14.62 *'Natural*

[14] Although the Lewes JCS HRA assessment of impacts on Ashdown Forest was successfully challenged at Judicial Review, the assessment relating to that SAC was not challenged because air quality calculations were undertaken, 'in combination' with growth arising from all sources and the HRA for that European site was therefore legally compliant.

England's advice [quoted in paragraph 14.52] *that this* [the woodland] *is not an area of concern*'.

Pevensey Levels SAC and Ramsar site

3.15 Pevensey Levels SAC and Ramsar site is designated for[15]:

- Little Ramshorn whirlpool snail *Anisus vorticulus*
- Outstanding assemblage of wetland plants and invertebrates including many British Red Data Book species.
- Supporting 68% of vascular plant species in Great Britain that can be described as aquatic. It is probably the best site in Britain for freshwater molluscs, one of the five best sites for aquatic beetles Coleoptera and supports an outstanding assemblage of dragonflies Odonata.

3.16 Relevant environmental factors include:

- Good water quality; low direct nutrient enrichment, particularly from fluvial sources; management of non-native species; an appropriate hydrological regime; and low recreational pressure.

3.17 Lewes' Joint Core Strategy HRA[16] concluded no likely significant effects as a result of development from Lewes District alone or in combination with other plans and projects. Pevensey Levels SAC and Ramsar site can be screened out from further consideration.

3.18 The Pevensey Levels SAC and Ramsar interest features are not sensitive to atmospheric ammonia, NOx or nitrogen deposition. This is supported by reference to the UK Air Pollution Information System which does not list any interest features of the SAC as being sensitive to atmospheric nitrogen deposition, NOx or ammonia. It is also noted that the Site Improvement Plan produced by Natural England does not mention air quality as a concern and AECOM understands from personal communication from Natural England officers that they do not currently see atmospheric nitrogen deposition as a risk to the integrity of this site. The Pevensey Levels SAC is designated for its population of lesser ramshorn whirlpool snail (*Anisus vorticulus*), while the Ramsar site is designated for both this snail and a range of other internationally important aquatic invertebrates and aquatic plants in the ditch network on site. The site also provides habitat for breeding and wintering birds but these are not a reason for Ramsar designation.

3.19 While eutrophication (excessive vegetation growth from nutrient enrichment) is a risk, the ditches of the Pevensey Levels (like most freshwater bodies) are understood to be 'phosphate-limited', meaning that phosphate is the most important nutrient to control. Natural England emphasise the role of phosphorus in text quoted in paragraph 15.47 of the recently published Wealden Local Plan HRA (August 2018). Phosphate does not derive from atmosphere but does come in large volumes from agricultural runoff and treated sewage effluent. For Pevensey Levels SAC/Ramsar site the discharges of Hailsham North and Hailsham South WwTW will be particularly significant. Provided phosphate levels can be controlled then nitrogen inputs (even through the water column) are unlikely to have a material effect on plant growth/habitat structure in the ditches. This is why, in most freshwater SACs and Ramsar sites, the attention is focussed on controlling phosphate inputs rather than nitrogen inputs.

3.20 In their recently published HRA of their Local Plan, Wealden District Council model nitrogen deposition under three scenarios. Each scenario postulates a differing trend in future vehicle emissions technology from no improvement and thus a reversal of current trends (Scenario A) to the full improvement allowance advocated in the Design Manual for Roads and Bridges (Scenario C). The most balanced scenario is Scenario B, which is more cautious than DMRB but not unrealistically conservative. Since there are no applicable nitrogen critical loads, or NOx or ammonia critical levels, for the interest features of this SAC or Ramsar site, there are no

[15] JNCC (2011). Natura 2000. Standard Data Form. Pevensey Levels SAC http://jncc.defra.gov.uk/protectedsites/sacselection/n2kforms/UK0030367.pdf [accessed 03/10/2017]
JNCC (2008). Information Sheet on Ramsar Wetlands (RIS). Pevensey Levels Ramsar. http://jncc.defra.gov.uk/pdf/RIS/UK11053.pdf [accessed 03/10/2017]

[16] http://www.lewes.gov.uk/planning/20408.asp

appropriate reference levels/damage thresholds for any impact assessment. In the Wealden Local Plan modelling this is dealt with in the following manner: '*a generic 'fen, marsh and swamp' habitat* [for which a critical load is available] *is considered in this assessment of ditch freshwater habitat*' (paragraph 15.40) despite the fact that these are not equivalent habitats. Even taking this approach, when all growth in combination is taken into account Scenario B indicates that '…*exceedances are predicted 1m from the A259 and apply to around 65% of its length only'* (paragraph 15.28). Moreover Table 67 shows that, while the critical load for generic fen, marsh and swamp will continue to be exceeded, there is nonetheless forecast to be a net improvement in both pollutants expected by 2028 under Scenario B and Scenario C and as already discussed 'fen, marsh and swamp' is not the interest feature of the SAC or Ramsar site.

3.21 It is therefore considered that a conclusion of no likely significant effect due to air quality, either alone or in combination, remains appropriate.

Ashdown Forest SPA and SAC

3.22 Ashdown Forest is an extensive area of common land lying between East Grinstead and Crowborough. It is one of the largest single continuous blocks of heath, semi-natural woodland and valley bog in south-east England, and it supports several uncommon plants, a rich invertebrate fauna, and important populations of heath and woodland birds.

3.23 The SPA is designated for the following features[17]:

Annex I species

- European nightjar *Caprimulgus europaeus* (breeding)
- Dartford warbler *Sylvia undata* (breeding)

3.24 The SAC is designated for the following features[18]:

Annex I habitats

- Northern Atlantic wet heaths with *Erica tetralix*
- European dry heaths

Annex II species

- Great crested newt *Triturus cristatus*

3.25 Relevant environmental factors include:

3.26 Good air quality; good water quality; appropriate grazing regime; appropriate hydrological regime; low recreational pressure; suitable foraging habitat for great crested newts within 500m of breeding ponds; retaining habitat connectivity for great crested newts; and, ponds with sufficient water supply to ensure they are wet from February to August (at least once in three years).

3.27 The Joint Core Strategy HRA[19] and a later Addendum (See **Appendix B**) undertook an 'in combination' assessment of Ashdown Forest SPA and SAC. This concluded that there would be no adverse effect on the integrity of the designated site due to growth in Lewes 'in combination' with that in other authorities, with the exception of 'in combination' impacts resulting from increased recreational pressure. In response to this conclusion, Lewes Joint Core Strategy (JCS) policy was worded to include strategic recreational mitigation. This is detailed below.

3.28 Refer to the HRA Addendum for the full details of the air quality analysis. In summary, the analysis concludes that ammonia concentrations at the closest areas of heathland to affected roads (5m from the A275 and A22) are below 1 μm^{-3} and nitrogen deposition rates along all links are forecast to experience a net improvement of 1.6-1.9 kgN/ha/yr by 2033, even allowing for traffic growth, due to improvements in NOx emission factors and background

[17] JNCC (2006). Ashdown Forest SPA Natura 2000 Standard Data Form. http://jncc.defra.gov.uk/pdf/SPA/UK9012181.pdf [accessed 04/10/2017]
[18] JNCC (2011). Ashdown Forest SAC Natura 2000 Standard Data Form http://jncc.defra.gov.uk/protectedsites/sacselection/n2kforms/UK0030080.pdf [accessed 04/10/2017]
[19] http://www.lewes.gov.uk/planning/20408.asp

concentrations/deposition rates over the same timetable. The maximum 'in combination' additional nitrogen deposition forecast to the nearest areas of heathland by 2033 is 0.3 kgN/ha/yr. Based on published research into dose-response relationships in heathland this would be c. 25% of the nitrogen 'dose' that might result in a significant retardation of any improvement in species richness that might otherwise be observed at the forecast background deposition rates and is not expected to result in a significant change in grass cover. Moreover, the contribution of the JCS (and South Downs Local Plan) is negligible, being a maximum 0.07 kgN/ha/yr at the roadside of the A275.

3.29 Since the overall trend to 2033 is expected to be a positive one and will not be retarded to an ecologically significant extent either by all forecast traffic growth 'in combination' or by the JCS (and South Downs Local Plan), there is thus not considered to be an adverse effect in combination with growth arising from surrounding authorities.

Recreational Pressure on Ashdown Forest Special Protection Area and Special Area of Conservation

3.30 Concern regarding the effects of disturbance on birds in particular, stems from the fact that they are expending energy unnecessarily and the time they spend responding to disturbance is time that is not spent feeding[20]. Disturbance therefore risks increasing energetic output while reducing energetic input, which can adversely affect the 'condition' and ultimately survival of the birds. In addition, displacement of birds from one feeding site to others can increase the pressure on the resources available within the remaining sites, as they have to sustain a greater number of birds.[21] Winter activity can cause important disturbance, especially as birds are particularly vulnerable at this time of year due to food shortages.

3.31 In 2010 a visitor survey of Ashdown Forest SAC and SPA was undertaken[22]. This survey fed into HRA reports of strategic documents at the time. These essentially identified a strategy broadly analogous to that devised for the Thames Basin Heaths; namely the identification of a series of zones around the SAC/SPA each of which triggered a combination of provision of alternative greenspace and improved access management. At that time, a 7 km 'outer zone' for Ashdown Forest SAC and SPA was agreed with Natural England[23]. Affected authorities that provided development within this affected 7 km 'zone' were required to provide a financial contribution to Suitable Alternative Natural Greenspaces (SANGs), an access strategy (SAMM) for Ashdown Forest and a programme of monitoring and research. This approach was supported by Natural England and the Ashdown Forest Conservators.

3.32 In 2016 Footprint Ecology updated the visitor survey[24] on behalf of the participating Councils, in order to provide comprehensive and up-to-date data on recreational use of Ashdown Forest and inform the strategic implementation of access management measures, the direction of strategic access management and monitoring, the design and ongoing management of SANG to ensure they functionally divert recreational pressure from Ashdown Forest and to assist local authorities in undertaking planning functions in relation to the Habitats Regulations. That updated survey has resulted in a review of the zones, although the 7km zone is still recognised as a core zone for delivering mitigation.

3.33 In summary, the 2016 survey identified that the 7km zone still captured the majority of visitors (including the vast majority of frequent (i.e. at least monthly) visitors) to the SAC/SPA. The survey identified that c. 81% of survey respondents whose postcodes could be mapped lived

[23] UE Associates. October 2011. Habitat Regulations Assessment for the Mid-Sussex District Plan

[24] Liley, D., Panter, C. & Blake, D. (2016). Ashdown Forest Visitor Survey 2016. Footprint Ecology Unpublished report.

within 7km of the SAC/SPA boundary[25]. It also identified that 84% of all interviewees[26] whose postcodes were mapped were from Wealden District or Mid-Sussex District.

3.34 The 2016 visitor survey identified that, of 452 visitors surveyed, a total of twelve had travelled from Lewes District, which accounts for barely 2.5% of visitors irrespective of frequency or purpose of visit.

3.35 Further examining the 2016 visitor survey data with specific regard to its relevance to Lewes District identifies that:

- Focussing on *'frequent'* users (visiting at least once a week), only three of the respondents from Lewes District (1%[27]) was a frequent user. In contrast, 94% of frequent visitors came from Wealden or Mid-Sussex.
- The closest settlement to the forest from which Lewes resident visitors derived was Newick, located almost 3km from the SAC and SPA at its closest;

3.36 Given the very small proportion of visitors to Ashdown Forest from Lewes and the infrequency of visits made by even these visitors, it is clear that Ashdown Forest is relatively little used for recreational activity by residents from the District. Therefore the 7km zone is considered to capture the 'in combination' effect of all net new housing growth around the SAC. This conclusion is also drawn in the August 2018 version of the Wealden Local Plan HRA.

3.37 Lewes' Joint Core Strategy Core Policy 10 (Natural Environment and Landscape Character), provides strategic protection from increases in recreational pressure for this designated site as follows:

'3. To ensure that the Ashdown Forest (SAC and SPA) is protected from recreational pressure, residential development that results in a net increase of one or more dwellings within 7km of the Ashdown Forest will be required to contribute to:

i. The provision of Suitable Alternative Natural Greenspaces (SANGs) at the ratio of 8 hectares per additional 1,000 residents; and

ii. The implementation of an Ashdown Forest Strategic Access Management and Monitoring Strategy (SAAMS)

Until such a time that appropriate mitigation is delivered, development that results in a net increase of one or more dwellings within 7km of Ashdown Forest, will be resisted. Applicants may consider mitigation solutions other than SANGs in order to bring forward residential development. Such solutions would need to be agreed with the District Council and Natural England.'

3.38 Within the 7km zone of influence the requirement for financial contribution to the Strategic Access Management and Monitoring Strategy has been agreed and is set at £1,170 per dwelling[28]. At the time of writing this report, this Strategy has not yet been finalised however there is an interim agreement in place to allow contributions to be collected and certain projects advanced. The Tariff Guidance Document[29] provides further information.

Summary

3.39 In summary, the only impact pathway that requires consideration in the LPP2 HRA is recreational pressure upon Ashdown Forest SPA and SAC as this is the only impact pathway for which a conclusion of no likely significant effect or no adverse effect on integrity could not be reached for the growth in the Joint Core Strategy without mitigation.

[25] A total of 353 respondents out of a total of 434 responses. This is a relevant statistic because the third quartile (75%) is the most widely used basis across the UK to define the primary recreational zone around European sites for which mitigation for additional residents should automatically be provided.
[26] Excluding those who were on holiday or staying with friends or family
[27] 3 out of 285 respondents who visited at least once a week according to Tables 18 and 6 of the visitor survey report

3.40 A settlement-by-settlement and, where required, site-by-site appraisal for the sites under consideration which underlies this commentary is provided in **Table 1** in **Chapter 4.** The screening of DM policies is undertaken in **Table 2** in **Chapter 4.**

4. Likely Significant Effects Screening

Screening of Residential and Employment Site Allocations and Settlements to Provide a Quantum of Residential Development and Employment Opportunities

4.1 Table 1 below undertakes screening of settlements identified to provide residential development and employment opportunities. This is provided either in the form of specific site allocations (eleven residential site allocations and two employment site allocations are provided) or by referencing Neighbourhood Plans (adopted and emerging) that provide a quantum of development and in some cases allocates sites for development that meets the requirements of the Joint Core Strategy. Table 1 also undertakes screening of the site allocations. The locations of the Parishes providing development and residential site allocations identified in Table 1 are illustrated in **Appendix A, Figure A1**.

4.2 In Table 1, where the 'HRA Screening Outcome' column is coloured green, development within this settlement is unlikely to lead to a likely significant effect alone, while orange means that a likely significant effect cannot be dismissed following this initial sift and therefore the implications of the settlements are considered further in subsequent sections of this report.

Table 1: HRA Screening Assessment of Settlements Identified to Provide New Residential Development within Lewes' Local Plan Part 2 Document

Settlement[30]	Nearest Straight Line Distances of Settlement from Internationally Designated Sites	Policy Reference	LPP2 Allocation or a quantum of development provided within a Neighbourhood Plan	HRA Screening Outcome
Housing Site Allocations - Towns				
Newhaven	• 4.6km from Lewes Downs SAC; • 7.1km from Castle Hill SAC • 14.6km from Pevensey Levels SAC and Ramsar site; and, • 22km from Ashdown Forest SPA and SAC	Two previous 2003 LDLP housing allocations have been reviewed and retained for LPP2. These are: NH01 - South of Valley Road; and NH02 - Land at The Marina	The Joint Core Strategy sets out provision of a minimum of 425 dwellings. Newhaven Town Council is preparing their Neighbourhood Plan that is expected to allocate approximately 450 new dwellings.	No HRA implications. Due to the distances involved there are no impact pathways present.
Peacehaven & Telscombe	• 4km from Castle Hill SAC • 5.8 km from Lewes Downs SAC • 18.1km	The Town Councils are currently at an early stage of preparation. The District Council will maintain a supporting role as they progress their neighbourhood plan to submission.	The Joint Core Strategy sets out provision of a minimum of 255 dwellings. Peacehaven & Telscombe are preparing their own Neighbourhood Plan which will include residential site allocations. At the time of	No HRA implications. Due to the distances involved future allocations made within Neighbourhood

[30] See Appendix A, Figure A1 for locations of all site allocations.

Settlement[30]	Nearest Straight Line Distances of Settlement from Internationally Designated Sites	Policy Reference	LPP2 Allocation or a quantum of development provided within a Neighbourhood Plan	HRA Screening Outcome
	from Pevensey Levels SAC and Ramsar site; and, • 23km from Ashdown Forest SPA and SAC		writing no allocations for residential development had been identified.	Plans are unlikely to give rise to significant effects. There are no impact pathways present.
Seaford	• 8.2km from Lewes Downs SAC • 9.5km from Castle Hill SAC • 11.6km from Pevensey Levels SAC and Ramsar site; and, • 25km from Ashdown Forest SPA and SAC	The Town Council is currently preparing a neighbourhood plan that will identify housing site allocations to meet their identified level of growth over the Plan period.	The Joint Core Strategy sets out provision of a minimum of 185 dwellings. Seaford Town Council is preparing its own Neighbourhood Plan. Allocations are all within the planning boundary. The LPP2 does not provide any site allocations in Seaford; however a recent resolution to grant outline planning permission for 183 new dwellings (Newlands School) accounts for 183 of the 'floating 200' in JCS Policy SP2.	No HRA implications. Due to the distances involved allocations made within Neighbourhood Plans are unlikely to give rise to significant effects. There are no impact pathways present.
Edge of Burgess Hill (within Wivelsfield Parish)	• 11km from Castle Hill SAC; • 11.3km from Lewes Downs SAC; • 13.6km from Ashdown Forest SPA and SAC; and, • 28.1km from Pevensey Levels SAC and Ramsar site.	BH/01 - Land at The Nuggets, Valebridge Road,	The Joint Core Strategy sets out provision of a minimum of 100 dwellings. At the time of writing 81 dwellings have been approved at Edge of Burgess Hill (within Wivelsfield Parish). A further site has been identified within the LPP2, delivering 14 net additional dwellings. However, the shortfall has been balanced by other nearby settlements exceeding their planned housing figure through either site allocations and/ or permitted unidentified sites.	No HRA implications. Due to the distances involved there are no impact pathways present.
Villages				
Barcombe Cross	• 4.3km from Lewes Downs SAC; • 9.5km from Castle Hill SAC;	LPP2 provides three residential site allocations in this settlement: BA/01 - Land at Hillside Nurseries, High Street; BA/02 - Land adjacent	The Joint Core Strategy sets out provision of a minimum of 30 dwellings. Barcombe Parish is in the early stages of preparing a Neighbourhood Plan which will not provide residential site allocations.	No HRA implications. Due to the distances involved there are no impact pathways

Settlement[30]	Nearest Straight Line Distances of Settlement from Internationally Designated Sites	Policy Reference	LPP2 Allocation or a quantum of development provided within a Neighbourhood Plan	HRA Screening Outcome
	• 10.4km from Ashdown Forest SPA and SAC; and, • 18.6km from Pevensey Levels SAC and Ramsar site.	to the High Street; and BA/03 - Land at Bridgelands.	Therefore, the District Council has identified housing site allocations to meet the housing numbers required at Barcombe Cross. In total, site allocations for 38 new dwellings have been identified, 8 above the minimum requirement for the settlement.	present.
North Chailey	• 7.1km from Ashdown Forest SPA and SAC; • 9.8km from Lewes Downs SAC; • 13.7km from Castle Hill SAC; and, • 22.5km from Pevensey Levels SAC and Ramsar site.	LPP2 provides two residential site allocations in this settlement: CH/01 – Glendene, Station Road; and CH/02 – Layden Hall, East Grinstead Road. These allocations deliver a combined total of 16 net additional dwellings.	The Joint Core Strategy sets out provision of a minimum of 30 dwellings. Chailey Parish is in the early stages of preparing a Neighbourhood Plan which will not provide residential site allocations. The Kings Head has been identified within SHELAA assessments has now been approved and is under construction, providing 15 additional dwellings. With site allocations set out within the LPP2, a total of 31 additional dwellings will be provided.	No HRA implications. The closest of the two site allocations provided within North Chailey to Ashdown Forest SPA and SAC is CH/01 – Glendene, Station Road which is located 7.8 km from the designated sites. CH/02 – Layden Hall, East Grinstead Road is located 8.3 km from the designated site. Due to the distances involved there are no considered to be no likely significant effects[31].
South Chailey	• 6.7km from Lewes Downs SAC; • 10km from Castle Hill SAC; • 10.8km from	CH/03 – Land adjacent to Mill Lane.	The Joint Core Strategy sets out provision of a minimum of 10 dwellings. Chailey Parish is in the early stages of preparing a Neighbourhood Plan which will not provide residential site allocations. LPP2 provides a single residential site allocation within this settlement which	No HRA implications. Due to the distances involved there are no impact pathways present.

[31] Visitor survey data for Ashdown Forest indicates that very few visitors to the SAC arise from those parts of Lewes District that lie more than 7km from the SAC/SPA. Growth beyond 7km in this district is considered to play a de minimis role in the contribution of growth in Lewes District to recreational pressure.

Settlement[30]	Nearest Straight Line Distances of Settlement from Internationally Designated Sites	Policy Reference	LPP2 Allocation or a quantum of development provided within a Neighbourhood Plan	HRA Screening Outcome
	Ashdown Forest SPA and SAC • 21.9km from Pevensey Levels SAC and Ramsar site.		will provide all 10 additional dwellings required.	
Cooksbridge	• 2.9km from Lewes Downs SAC • 6.6km from Castle Hill SAC; • 13.7km from Ashdown Forest SPA and SAC; and, • 20.6km from Pevensey Levels SAC and Ramsar site.	No residential site allocations are provided within LPP2 at this settlement.	The Joint Core Strategy sets out provision of a minimum of 30 dwellings. Hamsey Parish Council made its Neighbourhood Plan in 2016 and does not allocate any residential sites. However, since the adoption of the Core Strategy a single site has been granted planning permission for 27 dwellings and is under construction. It is not anticipated that the shortfall will be met within this settlement.	No HRA implications. Due to the distances involved, there are no impact pathways present
Plumpton Green	• 7.3km from Lewes Downs SAC • 8.6km from Castle Hill SAC; and, • 12.8km from Ashdown Forest SPA and SAC • 24.3km from Pevensey Levels SAC and Ramsar site.	No residential site allocations are provided within LPP2 at this settlement.	The Joint Core Strategy sets out provision of a minimum of 50 dwellings. Plumpton Parish has a 'made' Neighbourhood Plan that allocates residential sites to satisfy the Joint Core Strategy. The Neighborhood Plan contains a number of housing policies and allocates four housing sites totaling 68 net additional dwellings.	No HRA implications. Due to the distances involved allocations made within the Neighbourhood Plan are unlikely to give rise to significant effects. There are no impact pathways present
Ringmer & Broyle Side	• 0.9km from Lewes Downs SAC; • 8km from Castle Hill SAC;	RG01 - Caburn Field (located 1.8 km from Lewes Downs SAC).	The Joint Core Strategy sets out provision of a minimum of 215 dwellings. Ringmer Parish Council made a Neighbourhood Plan in 2016 and resultant residential site allocation development is expected to provide 183	No HRA implications. Due to the distances involved there are no impact pathways

Settlement[30]	Nearest Straight Line Distances of Settlement from Internationally Designated Sites	Policy Reference	LPP2 Allocation or a quantum of development provided within a Neighbourhood Plan	HRA Screening Outcome
	• 12.2km from Ashdown Forest SPA and SAC; and, • 13.8km from Pevensey Levels SAC and Ramsar site.		dwellings, leaving a shortfall of 32 dwellings. The shortfall will be provided by policies set out within the LPP2.	present.
Wivelsfield Green	• 11.7km from Lewes Downs SAC; • 12.8km from Castle Hill SAC; • 11.9km from Ashdown Forest SPA and SAC; and, • 26.9km from Pevensey Levels SAC and Ramsar site.	No residential site allocations are provided within LPP2 at this settlement.	The Joint Core Strategy sets out provision of a minimum of 30 dwellings. Wivelsfield Parish Council made their Neighbourhood Plan in 2016, allocating 34 new dwellings, of which 30 are subject to an outline planning permission.	No HRA implications. Due to the distances involved allocations within the made Neighbourhood Plans are unlikely to give rise to significant effects. There are no impact pathways present
Newick	• 5.8km from Ashdown Forest SPA and SAC; • 9.3km from Lewes Downs SAC; • 14km from Castle Hill SAC; and, • 20.7km from Pevensey Levels SAC and Ramsar site.	No residential site allocations are provided within LPP2 at this settlement.	The Joint Core Strategy sets out provision of a minimum of 100 dwellings. This quantum of development has been identified through the Newick Neighbourhood Plan site allocations. As such LPP2 does not provide any site allocations. Since the area lies well within 7km of Ashdown Forest, the proposals map also identifies the Newick SANG, known as Reedens Meadows.	Likely significant effect in the absence of mitigation. This settlement is located within 7 km of Ashdown Forest SPA and SAC.
Gypsy and Traveller Accommodation				
Gypsy and Traveller Accommodation	• 12.2km from Ashdown Forest SAC	GT01 – Land south of The Plough. This policy meets the Council's duty to make provision	Core Policy 3 of the Local Plan Part 1 sets out a requirement for 13 net additional permanent pitches	No HRA implications. There are no impact

Settlement[30]	Nearest Straight Line Distances of Settlement from Internationally Designated Sites	Policy Reference	LPP2 Allocation or a quantum of development provided within a Neighbourhood Plan	HRA Screening Outcome
	and SPA; • 9km from Lewes Downs SAC; • 24.9km from Pevensey Levels SAC and Ramsar site; • 10.6km from Castle Hill SAC	for 5 permanent pitches.	for Gypsies and Travellers Five permanent pitches are allocated through LLP2. Five permanent pitches are allocated in the South Downs Local Plan, leaving an outstanding requirement for 3 to be delivered within the SDNP.	pathways present
Employment Site Allocations				
Land at East Quay, Newhaven Port	• 8.5km from Lewes Downs SAC; • 9km from Castle Hill SAC • 16.5km from Pevensey Levels SAC and Ramsar site. • 26.4km from Ashdown Forest SPA and SAC.	Policy E1: Land at East Quay, Newhaven Port	There is no requirement to allocate additional sites in the LLP2. In 2016, NPP were granted planning permission for the expansion of the existing working port area. further expansion and enhancement of Newhaven Port is encouraged.	No HRA implications. Due to the distances involved future allocations made within Neighbourhood Plans are unlikely to give rise to significant effects. There are no impact pathways present
Land Adjacent to American Express Community Stadium, Village Way, Falmer	• 7.5km from Lewes Downs SAC; • 2.1km from Castle Hill SAC; • 20.8km from Ashdown Forest SPA and SAC; • 25km from Pevensey Levels SAC and Ramsar site.	Policy E2: Land Adjacent to American Express Community Stadium, Village Way, Falmer Development must comply with all appropriate development plan policies and approved criteria.	A new opportunity for employment development to enhance the stadium facilities by providing offices or health/ education uses associated with the stadium or with Sussex and Brighton Universities.	No likely significant effect due to absence of impact pathways.

Assessment 'In Combination'

4.3 Lewes LPP2 requires consideration in combination with other projects and plans that could interact with European designated sites.

4.4 The quantum of both residential and employment development provided by Lewes' LPP2 could interact with European designated site in combination with other projects and plans. However, as the LPP2 does not provide for a quantum of development beyond that provided within the adopted Joint Core Strategy and as previously stated in Chapter 3, only recreational pressure impacts upon Ashdown Forest SPA and SAC require further consideration in combination (air quality impacts in combination have been covered in the aforementioned Core Strategy HRA Addendum).

4.5 The 7km zone for recreational pressure has been specifically set to capture the 'in combination' contribution of housing growth in Lewes District to recreational pressure on Ashdown Forest SAC/SPA, as the role of Lewes District in isolation would be negligible. The residential development allocated within the LPP2 is all located more than 7 km from Ashdown Forest SAC and SPA as is that in Neighbourhood Plans in Lewes District, with the sole exception of Newick. Residential development allocated within the 7km zone by the adopted Newick Neighbourhood Plan and potential windfall development within Lewes district that falls within the 7 km zone (provided by the adopted JCS) could therefore result in a likely significant effect 'in combination' with other housing growth elsewhere within or close to 7km of the SAC/SPA (bearing in mind that the 7km distance is not intended to be precise to the nearest metre).

4.6 Since development within, or close to, 7km of the SAC/SPA requires mitigation to address recreational pressure effects 'in combination' this is the subject of the appropriate assessment (Chapter 5).

Screening of Development Management Policies

4.7 Table 2 provides the screening assessment of the DM policies for Lewes' LPP2. The LPP2 contains both new policies and policies carried forward from the 2003 adopted Local Plan. Only new policies are assessed; those carried forward from the 2003 adopted Local Plan are not reassessed. Any policies identified in green within the 'HRA Screening Outcome' column will not result in a likely significant effect upon any European designated site. Those identified in orange have the potential to result in a likely significant effect and will be discussed later within the document.

Table 2: Screening of the Development Management Policies.

LPP2 Policy	Description	HRA Screening Outcome
Spatial Strategy		
Policy DM1: Planning Boundary	Within the planning boundaries, as defined on the Policies Map, new development will be permitted provided that it is in accordance with other policies and proposals in the development plan. Outside the defined planning boundaries, the distinctive character and quality of the countryside will be protected and new development will only be permitted where it is consistent with a specific development plan policy or where the need for a countryside location can be demonstrated. Development proposals that result in a net increase of one or more dwellings within 7km of the Ashdown Forest will only be permitted where they comply with Core Policy 10(3) of the Local Plan Part 1.	No HRA implications. This development management policy identifies planning boundaries for new development and outlines policy guidance relating to development both inside and outside of the planning boundaries. This policy does not detail any specific locations, type or quantum of development outside of the planning boundaries. This policy also provides explicit reference to the need for development that provides new residential development within 7 km of the Ashdown Forest SPA and SAC to comply with Core Policy 10(3) of the Local Plan Part 1[32]. As such there are no impact pathways present and this policy can be screened out.
Policy DM2: Affordable Homes Exception Sites	Outside the planning boundaries, as defined on the Proposals Map, proposals for affordable housing to meet local needs will be permitted where the following criteria are met: (1) the proposed development will assist in meeting an identified and genuine local need in terms of the sizes, types, and tenures of the dwellings;	No HRA implications. This is a development management policy relating to the provision of affordable housing and exceptionally market housing to finance the affordable, outside of the planning

[32] Core Policy 10(3) states:
'3. To ensure that the Ashdown Forest (SAC and SPA) is protected from recreational pressure, residential development that results in a net increase of one or more dwellings within 7km of the Ashdown Forest will be required to contribute to:
i. The provision of Suitable Alternative Natural Greenspaces (SANGs) at the ratio of 8 hectares per additional 1,000 residents; and
ii. The implementation of an Ashdown Forest Strategic Access Management and Monitoring Strategy (SAMMS).
Until such a time that appropriate mitigation is delivered, development that results in a net increase of one or more dwellings within 7km of Ashdown Forest will be resisted. Applicants may consider mitigation solutions other than SANGs in order to bring forward residential development. Such solutions would need to be agreed with the District Council and Natural England.'

LPP2 Policy	Description	HRA Screening Outcome
	(2) the proposed development is within, adjacent to, or otherwise well related to an existing village or other settlement; (3) the scale and design of the development is appropriate to the nature of the settlement and will respect its character and setting; (4) the affordable housing is made available to, and will be retained in perpetuity for, households with a local connection; (5) the proposed scheme is subject to an appropriate legal agreement to ensure that it is able to be properly managed by a partner Registered Provider or other approved body; (6) development proposals within 7km of the Ashdown Forest comply with Core Policy 10(3) of the Local Plan Part 1. The inclusion of open market housing will not normally be supported unless it can be demonstrated that an affordable housing scheme that meets the above criteria would be unviable without cross-subsidy. In such exceptional circumstances, the amount of market housing must be lower than the amount of affordable housing and at the lowest proportion that will enable the delivery of significant affordable housing.	boundaries. This policy does not identify any locations for development. However, there is potential for small scale residential development to occur within 7 km of Ashdown Forest SPA and SAC as a result. Point 6 of this policy provides explicit reference to the need for development that provides new residential development within 7 km of the Ashdown Forest SPA and SAC to comply with Core Policy 10(3) of the Local Plan Part 1.[33] As such there are no impact pathways present and this policy can be screened out.
Policy DM3: Accommodation for Agricultural and Other Rural Workers	Outside the planning boundaries, as defined on the Policies Map, new permanent dwellings will be permitted for those employed in agriculture, forestry or another enterprise requiring a countryside location where it can be demonstrated that the following criteria are met: (1) there is a clearly established existing functional need; (2) the functional need relates to a full-time worker; (3) the unit and the rural enterprise concerned have been established for at least three years, have been profitable for at least one of them, are currently financially sound and have a clear prospect of remaining so; (4) the functional need cannot be met by another existing dwelling on the unit or other existing accommodation in the area which is suitable and available for occupation by	No HRA implications A development management policy relating to agricultural and other rural workers accommodation. Whilst the scale of new residential development as a result of this policy is likely to be small, it could be located within 7 km Ashdown Forest SAC and SPA and as such result in a likely significant effect. However, this policy provides explicit reference to the need for development that provides new residential development within 7 km of the

[33] Ibid

LPP2 Policy	Description	HRA Screening Outcome
	the workers concerned; (5) the proposed dwelling, and any subsequent extension, is of a size commensurate with the established functional need of the enterprise. Dwellings and any subsequent extensions which are unusually large in relation to the needs of the unit or unusually expensive to construct in relation to the income it can sustain in the long term will not be permitted; (6) the dwelling is suitably located to meet the identified functional need of the enterprise, is well related to existing buildings wherever possible, and its siting and design is appropriate to the rural character of the locality. Where the functional need is proven but Criterion 3 is not met, a temporary permission will be granted for a caravan, mobile home or other temporary accommodation where it can be demonstrated that the following criteria are met: (i) Criteria (1) and (4) above; (ii) there is clear evidence of a firm intention and ability to develop the enterprise concerned; (iii) there is clear evidence that the proposed enterprise has been planned on a sound financial basis. Occupancy conditions will be imposed on dwellings permitted in accordance with this policy and, where appropriate, on other dwellings within the holding. Applications to remove such conditions will only be permitted where it can be demonstrated that all the following criteria are met: (a) the essential need which originally justified the dwelling no longer applies and the dwelling will not be required to meet such need in the longer term; (b) the property has been actively marketed in specialist and local press and estate agents at least once a month for a minimum of 12 months; (c) the advertised selling price or rental is realistic given the age, size, condition and location of the property; and (d) no realistic offers have been made to the vendors for occupation of the dwelling in compliance with the original occupancy condition.	Ashdown Forest SPA and SAC to comply with Core Policy 10(3) of the Local Plan Part 1.[34] As such there are no impact pathways present and this policy can be screened out.

[34] Ibid

LPP2 Policy	Description	HRA Screening Outcome
	In appropriate circumstances, the Council will seek a planning obligation to tie a permanent dwelling to adjacent buildings or to the land forming the holding. Proposals within 7km of the Ashdown Forest will only be permitted where they comply with Core Policy 10(3) of the Local Plan Part 1.	
Policy DM4: Residential Conversions in the Countryside	Proposals for the conversion of redundant agricultural or other rural buildings to residential use outside the planning boundaries, as defined on the Policies Map, will be permitted where the following criteria are met: (1) the building is of sound construction and capable of conversion without significant rebuilding, modification or extension. The Council will normally require this to be demonstrated through the submission of a structural survey; (2) the building is not in an exposed or isolated location where the construction of lengthy access roads or overhead power lines would be harmful to the rural character of the area; (3) the proposed development will lead to an enhancement to the immediate setting of the building, either by the removal of existing structures and features that detract from the character and identity of the locality or by improved boundary treatment that responds sensitively to the rural nature of the site; (4) any proposed alterations to the building (e.g. fenestration, doors, internal subdivision) would not harm its architectural integrity nor materially change its appearance as a rural building; (5) the creation of a residential curtilage would not detract from the rural setting of the building or harm the character of the wider landscape; (6) the proposal would not create an unacceptable impact on the local road network and there is a satisfactory means of vehicular access and parking arrangements; (7) the proposed development would not prejudice any viable agricultural operations; (8) development within 7km of the Ashdown Forest will comply with Core Policy 10(3) of	No HRA implications A development management policy relating to residential conversions in the countryside. Whilst the scale of new residential development as a result of this policy is likely to be small, it could be located within 7 km Ashdown Forest SAC and SPA and as such result in a likely significant effect. However, point 8 of this policy provides explicit reference to the need for development that provides new residential development within 7 km of the Ashdown Forest SPA and SAC to comply with Core Policy 10(3) of the Local Plan Part 1.[35] As such there are no impact pathways present and this policy can be screened out.

[35] Ibid

LPP2 Policy	Description	HRA Screening Outcome
	the Local Plan Part 1. Where appropriate, conditions may be imposed to remove permitted development rights.	
Policy DM5: Replacement Dwellings in the Countryside	Outside the planning boundaries, as defined on the Proposal Map, the replacement of an existing dwelling by another dwelling within the same residential curtilage will be permitted where the following criteria are met: (1) the scale, form, height, and massing of the replacement dwelling is compatible with its rural location and the surrounding form of development; (2) the replacement dwelling is located in the same or similar position of the existing dwelling, unless an alternative location would result in clear landscape, highway access or local amenity benefits. In sensitive locations, permitted development rights relating to future extensions and other structures may be removed.	No HRA implications A development management policy providing for the replacement of existing dwellings in the countryside. No locations are identified. There is the potential for this type of development to result in a very small population increase (for example if a house with a few bedrooms was replaced with a house with more bedrooms) that could result in an increase in recreational pressure within Ashdown Forest SPA/ SAC. At the Core Strategy level Core Policy 10 (3) (Natural Environment and Landscape Character), identifies that strategic financial contributions are required for '…*residential development that results in a net increase of one or more dwellings within 7km of the Ashdown Forest…'*, as such this policy can be screened out.
Policy DM6: Equestrian Development	Proposals for equestrian development will be permitted where the intrinsic and locally distinctive character and amenities of the countryside are maintained. In particular: (1) the siting, scale and design, including materials and boundary treatment, of any new buildings or facilities should be appropriate to their rural setting; (2) consideration will be given to the cumulative impact of equestrian developments on landscape character and features and biodiversity; (3) proposals should not be sited in prominent or isolated locations;	No HRA implications. This is a development management policy relating to equestrian development. It does not provide any location, quantum or type of development. There are no impact pathways present.

LPP2 Policy	Description	HRA Screening Outcome
	(4) all proposals, including sand schools, commercial riding schools, livery stables and related facilities, should be satisfactorily integrated with existing buildings; (5) any associated floodlighting, earthworks, new access routes or other ancillary structures, including storage facilities, manure bays, hard-standings, fencing and jumps, should not have an unacceptable adverse impact on the surrounding countryside, biodiversity or local residential amenities; (6) adequate provision should be made for the safety and comfort of horses in terms of the size of accommodation and land for grazing and exercising; (7) commercial riding schools, livery stables and other commercial facilities should have satisfactory access to the public bridleway network without the use of unsuitable roads. In some circumstances, conditions (such as the removal of permitted development rights for fencing and external storage) may be applied to prevent any potential harm to the local landscape.	
Policy DM7: Institutional Sites	Outside the planning boundaries, as defined on the Proposals Map, proposals for the change of use and conversion of land and buildings occupied by residential institutions will be permitted where the following criteria are met: (1) existing buildings which make a positive contribution to the existing character of the site will be retained; (2) existing buildings which are detrimental to the rural character of the locality will be removed; (3) the site is genuinely redundant; (4) development proposals that result in a net increase of one or more dwellings within 7km of the Ashdown Forest comply with Core Policy 10(3) of the Local Plan Part 1. Alternative uses will be assessed by consideration of the characteristics of the site, its buildings and setting, the availability of local services and the appropriateness of the proposed use.	No HRA implications. This policy identifies change of use of institutional sites outside of the planning boundaries. This policy does not detail any specific locations, type or quantum of development outside of the planning boundaries. However, if conversion is to residential use or holiday accommodation within 7km of Ashdown Forest SPA and SAC, this policy does have the potential to result in increased population (and therefore recreational pressure). Point 4 of this policy provides explicit reference to the need for development that provides new residential development within 7 km of the Ashdown Forest SPA and SAC to comply with

LPP2 Policy	Description	HRA Screening Outcome
		Core Policy 10(3) of the Local Plan Part 1[36]. There are no impact pathways present.
Improving Access to Housing		
Policy DM8: Residential Sub-Divisions and Shared Housing	Proposals for the sub-division of existing dwellings to flats or the conversion of existing dwellings to houses of multiple occupation or other forms of shared housing will be permitted where the following criteria are met: (1) there is adequate provision for car parking, private amenity space for residents, and storage for bicycles and recycling/refuse containers; (2) the proposal would not result in unacceptable harm to the amenities of neighbouring residential properties through loss of privacy or daylight or levels of activity that give rise to excessive noise or disturbance; (3) there would be no adverse impact on the character of the immediate locality through the cumulative impact of physical alterations or extensions to the original dwelling or other structures; Development proposals within 7km of the Ashdown Forest will only be permitted where they comply with Core Policy 10(3) of the Local Plan Part 1.	No HRA implications A development management policy providing for sub-division of existing dwellings or change of use to houses of multiple occupancy. Whilst no locations are specified, this has the potential to increase the net number of dwellings within 7 km of Ashdown Forest SPA and SAC. and as such result in a likely significant effect. This policy provides explicit reference to the need for development that provides new residential development within 7 km of the Ashdown Forest SPA and SAC to comply with Core Policy 10(3) of the Local Plan Part 1[37]. There are no impact pathways present.
Promoting Sustainable Economic Growth and Regeneration		
Policy DM9: Farm Diversification	Development which forms part of a farm diversification scheme or otherwise helps maintain the viability of farm businesses engaged in sustainable land management will be permitted where the following criteria are met: (1) the proposed development will stimulate new economic activity with a use appropriate to its rural location; (2) wherever possible, new or replacement buildings are located within or adjoining an	Potential HRA implications. A development management policy to provide for farm diversification. This policy does not identify any explicit type or location of diversification development.

[36] Ibid
[37] Ibid

LPP2 Policy	Description	HRA Screening Outcome
	existing group of buildings; (3) any new building responds sensitively to its rural setting, in terms of its scale, layout, design and use of materials; (4) the proposed development would not create an unacceptable impact on the local road network or require highway improvements that would harm the landscape or ecological value of rural roads in the area.	There are no impact pathways present.
Policy DM10: Employment Development in the Countryside	Outside the planning boundaries, as defined on the Proposal Map, proposals for small-scale employment development, including tourist and leisure facilities, will be permitted where either: (a) it involves the conversion or re-use of an existing agricultural or other rural building, or (b) it comprises the demolition and replacement of an existing agricultural or other rural building where this would result in a more sustainable development than could be achieved through converting the building. A building to be converted must be structurally sound and capable of conversion to the proposed use without the need for significant reconstruction, modification or extension. The Council will normally require this to be demonstrated through the submission of a structural survey. All proposals for the conversion or replacement of an existing agricultural or other rural building must also satisfy all the following criteria: (1) the detailed design responds sensitively to its rural setting, in terms of its scale, layout and use of materials; (2) the siting and design respects the local landscape character, both in terms of immediate impact and distant views; (3) the proposed boundary treatment is appropriate to a rural location and helps to integrate the development into the wider landscape; (4) unobtrusive provision can be made for any associated servicing and parking facilities or	No HRA implications. This is a spatial strategy policy relating to employment development. It does not identify any quantum, location or type of development. There are no impact pathways present.

LPP2 Policy	Description	HRA Screening Outcome
	plant, equipment or storage; (5) External lighting, or light spillage from internal lighting, is kept to the minimum necessary for operational or safety purposes; (6) the proposed use would not adversely affect the residential amenities of nearby properties by reason of the scale and nature of use, noise, dust, fumes or the general level and nature of activities; (7) the proposed use would not create an unacceptable impact on the local road network or require highway improvements that would harm the landscape or ecological value of rural roads in the area. (8) the proposed development would not prejudice any viable agricultural operations.	
Policy DM11: Existing Employment Sites in the Countryside	Outside the planning boundaries, as defined on the Proposals Map, the redevelopment or intensification of existing employment sites will be permitted for employment purposes where the following criteria are met:- (1) the existing development and employment use is lawful; (2) the proposed development would not detract from the distinctive rural character of the locality or local residential amenities by virtue of the nature and intensity of the use, noise, dust, fumes, the siting, design, scale and site coverage of the buildings, or its access requirements or associated traffic generation; (3) proposals which would be likely to create a significant number of jobs are well located in relation to neighbouring towns or villages and readily accessible by public transport. Exceptionally, the outward expansion of an existing employment site outside the planning boundaries will be permitted where it can be demonstrated that it would facilitate the retention of an employment use which is important to the local economy, subject to the above criteria and there being no suitable alternative site available. Proposals will be expected to deal comprehensively with the site as a whole and include measures to secure environmental improvements, such as enhanced landscaping and biodiversity gains.	No HRA implications. This is a spatial strategy policy relating to existing employment sites in the countryside. There are no impact pathways present.

LPP2 Policy	Description	HRA Screening Outcome
Policy DM12: Caravan and Camping Sites	Proposals for new or extended touring caravan and camping sites will be permitted where the following criteria are met: (1) there is reasonable accessibility from the primary or secondary route network; (2) the size and scale of the proposal would be compatible in terms of appearance and intensity of use with its location; (3) the proposal would not be visually intrusive in the landscape and would be adequately screened, either by existing vegetation or by a landscape scheme that enables the development to be accommodated without detracting from the character and quality of the countryside; (4) existing buildings or structures are used, where possible, to provide ancillary facilities; (5) the design of any new buildings responds sensitively to its rural setting, in terms of its scale, layout and use of materials (6) in the case of extensions to existing sites, the proposals should result in an improved layout and landscaping. Conditions will be applied to limit the use of the site in order to preclude its use as permanent residential accommodation or as winter storage for touring caravans. Proposals for new static caravan sites will not be permitted.	Potential HRA implications. This policy provides for new touring caravan and camping sites. It does not identify any location for extent of development. There are no impact pathways present.
Policy DM13: Existing Visitor Accommodation	Development which would result in the loss of existing visitor accommodation, including touring caravan and camping sites, will only be permitted where it can be demonstrated that either: (1) the building or land is no longer suitable to accommodate the current use and it is not economically viable to retain, enhance or reinstate the visitor accommodation through redevelopment of the site; or (2) there is no demand for the accommodation and it can no longer make a positive contribution to the local economy.	No HRA implications. A development management policy providing criteria detailing where it is acceptable for existing visitor accommodation to be lost. There are no impact pathways present.

LPP2 Policy	Description	HRA Screening Outcome
Creating Healthy, Sustainable Communities		
Policy DM14: Multi-functional Green Infrastructure	Development will be permitted where opportunities for the provision of additional green infrastructure have been fully considered and would be provided where justified by the character of the area or the need for outdoor playing space. Green infrastructure provided as part of new development should incorporate features to encourage biodiversity and retain or, where possible, enhance existing features of nature conservation value within the site. Existing ecological networks should be identified and ecological corridors should, where practical and appropriate, form an essential component of green infrastructure provision to ensure habitat connectivity.	No HRA implications. A positive policy that could potentially increase the network of green infrastructure within the District that could divert recreational pressure away from Ashdown Forest SPA and SAC. There are no impact pathways present.
Policy DM15: Provision for Outdoor Playing Space	The Council will seek to achieve provision of outdoor playing space, which is as a matter of practise and policy available for public use, to the following minimum standards: (a) 1.6 ha per 1000 population for outdoor sports, including playing pitches, tennis courts, and bowling greens; (b) 0.25 ha per 1000 population for equipped/designated children's play space; (c) 0.3 ha per 1000 population for other outdoor provision (multiple use games areas and skateboard parks). In areas where there is deficiency of outdoor playing space in either quantitative or qualitative terms, the impact of the increase in population from new residential development will be mitigated either by on-site provision or by the use of the Community Infrastructure Levy to secure the provision of new, or the enhancement of existing, outdoor playing space and facilities.	No HRA implications. This is a development management policy which outlines standards for the provision of outdoor playing space. There are no impact pathways present.
Policy DM16: Children's Play Space in New Housing Development	Residential developments of 20 dwellings or more will only be permitted where children's playing space is provided on-site in accordance with the minimum standards set out in criteria (b) of Policy DM15. This space should be: (1) integral to the overall design and layout of the development; (2) sited in safe, open and welcoming locations which are overlooked by dwellings and well	No HRA implications. This policy outlines standards for children's play space provision required within new housing development. There are no impact pathways present.

LPP2 Policy	Description	HRA Screening Outcome
	used pedestrian routes; (3) provided with seating for accompanying adults; (4) additional to any incidental amenity space; (5) properly drained, laid out, landscaped and equipped for use at an agreed stage or stages no later than the completion of the final dwelling of the development. The above standard will not be applied in the case of one-bedroom dwellings or specialist accommodation for older people or students.	
Policy DM17: Former Lewes/Sheffield Park Railway Line	Informal recreational uses, such as walking, cycling and horse-riding, will be permitted along the route of the undeveloped part of the Lewes/Sheffield Park railway line where it can be demonstrated that such uses would maintain or enhance the biodiversity value of the route. Development which would prejudice such uses will not be permitted unless proposals are accompanied by alternative route provision.	No HRA implications. This is a development management policy relating to the development of the undeveloped part of the former Lewes/Sheffield Park Railway Line. This policy provides for new areas to undertake recreational activities. As such, this is a positive policy, having potential to divert recreational pressure away from sensitive internationally designated sites. There are no impact pathways present.
Policy DM18: Recreation and Rivers	Development proposals for recreational use on the River Ouse, its margins and associated wetlands (as defined on the Proposals Map) will be permitted where it can be demonstrated that there would be no adverse impact, either directly or indirectly, on their quiet and natural character, wildlife or geological features or on the natural functioning of the river and associated wetlands.	No HRA implications. This policy provides for the protection of rivers with regards to recreational pressure and ensures that the quiet and natural character is retained and ensures no adverse effects arise either directly or indirectly upon wildlife. There are no impact pathways present.
Protecting and Enhancing the Distinctive Quality of the Environment		

LPP2 Policy	Description	HRA Screening Outcome
Policy DM19: Protection of Agricultural Land	Development that would result in the irreversible loss of the best and most versatile agricultural land (Grades 1, 2, 3a in the DEFRA Agricultural Land Classification System) will be permitted where it can be demonstrated that there are no suitable alternative locations and the proposal would have overriding sustainability benefits that outweigh the loss of land from agricultural use.	No HRA implications. This is a development management policy providing protection for the best and most versatile agricultural land. This policy does not identify any locations. There are no impact pathways present.
Policy DM20: Pollution Management	Development that may potentially contribute to, or be adversely affected by, unacceptable levels of soil, air, water, noise or light pollution will be permitted where it can be demonstrated that: (1) its location is appropriate in terms of land use in relation to the uses in the surrounding area; (2) the development will not have an unacceptable impact on health, the natural environment or general amenity; (3) the development will not have an adverse impact on the use of other land; (4) where relevant, the appropriate after-use of land can be secured	No HRA implications A development management policy providing criteria under which development will be permitted that may potentially contribute to levels of environmental pollution. There are no impact pathways present.
Policy DM21: Land Contamination	Development proposals on a site is that is known or suspected to be affected by contamination will be permitted where the Council is satisfied that all works, including investigation of the nature of any contamination, can be undertaken without escape of contaminants that could cause unacceptable risk to health or to the environment. Information should be provided detailing the methodology by which risks will be addressed and ensuring the treatment and/or removal of all contaminants prior to the commencement of development. Development will not be permitted unless practicable and effective measures are taken to avoid: (1) exposing the future occupiers and users of the development to unacceptable risk; (2) threatening the structural integrity of any building or structure built on or adjoining the site	No HRA implications A development management policy providing criteria under which development on already contaminated land will be permitted. There are no impact pathways present.

LPP2 Policy	Description	HRA Screening Outcome
	(3) causing the contamination of any water course, water body or aquifer; (4) causing the contamination of adjoining land or allowing such contamination to continue; (5) damaging or putting at risk the quality of the natural environment.	
Policy DM22: Water Resources and Water Quality	Development will be permitted where it can be demonstrated that it would not result in: (1) unacceptable risk to the quality and quantity of surface and groundwater (including reservoirs); or (2) changes to groundwater and surface water levels that would have unacceptable adverse impacts on: (a) adjoining land; (b) the quality of groundwater resources or potential groundwater resources; (c) the potential yield of groundwater resources, river flows or natural habitats. Work beneath the water table will not be permitted unless there is a comprehensive groundwater management scheme agreed for the construction, operation, restoration and on-going management of the proposal.	No HRA implications. This is a positive development management policy that provides criteria under which development will be permitted so as not result in a detrimental change to ground and surface water. There are no impact pathways present.
Policy DM23: Noise	Residential and other noise sensitive development will be permitted where it can be demonstrated that users of the development will not be exposed to unacceptable noise disturbance from existing or future uses. Noise-generating development will only be permitted where it can be demonstrated that nearby noise sensitive uses (existing or planned) will not be exposed to noise impact that will adversely affect the amenity of existing or future users. Where appropriate, proposals will be required to mitigate noise impacts through careful planning, layout and design. In assessing mitigation proposals, account will be taken of; 1) the location, layout and design of the proposed development; 2) existing levels of background noise;	No HRA implications. This is a development management policy relating to noise. There are no impact pathways present.

LPP2 Policy	Description	HRA Screening Outcome
	3) measures to reduce or contain generated noise 4) hours of operation and servicing Where noise sensitive uses are likely to be exposed to significant or unacceptable noise disturbance, the Council will require that applications are supported by a Noise Impact Assessment prepared in accordance with the Planning Noise Advice Document: Sussex (July 2015) or any subsequent updated document. Development that would expose noise sensitive uses to unacceptable noise levels will not be permitted.	
Policy DM24: Protection of Biodiversity and Geodiversity	Development which would be likely to adversely affect a designated Ramsar site, designated or candidate Special Area of Conservation (SAC) or a classified or potential Special Protection Area (SPA) will only be permitted where adverse likely significant effects can be avoided and/or mitigated against. After avoidance and mitigation measures have been considered, where residual adverse likely significant effects arise, development will only be permitted if there is no alternative solution, there are imperative reasons of over-riding public interest that would justify the development and suitable compensation is provided. Development proposals that result in a net increase of one or more dwellings within 7km of the Ashdown Forest will only be permitted where they comply with Core Policy 10(3) of the Local Plan Part 1. The requirement of Core Policy 10 (3i) can be fulfilled through a contribution towards the management and monitoring of the Suitable Alternative Natural Greenspace (SANG) at Newick, as defined on the Proposals Map. Development which would be likely to adversely affect a Site of Special Scientific Interest (SSSI), National Nature Reserve (NNR), or Marine Conservation Zone (MCZ) will only be permitted where the benefits of the development, at this site, outweigh the damage to the nationally recognised special interest of the designated site and any adverse impacts on the wider network of SSSIs. Development which would result in damage or loss to a site of biodiversity or geological value of regional or local importance including Local Nature Reserves (LNR), Wildlife Trust Reserves, Local Wildlife Sites, irreplaceable habitats, and habitats and species of principal importance for biodiversity, will only be permitted where the benefits of the development clearly outweigh the damage to the conservation interest of the site and any loss can be mitigated to achieve a net gain in biodiversity and/or geodiversity.	No HRA implications. This is a positive development management policy that provides overall protection for European designated sites. This policy also provides for the need for new residential development within 7 km of Ashdown Forest SPA and SAC to financial contributions towards SANG management. There are no linking impact pathways present.

LPP2 Policy	Description	HRA Screening Outcome
	Where development is permitted, the Council will use conditions and/or legal agreements in order to minimise the damage, ensure adequate mitigation and site management measures and, where appropriate, compensatory and enhancement measures.	
Policy DM25: Design	Development which contributes towards local character and distinctiveness through high quality design will be permitted where the following criteria are met: (1) Its siting, layout, density, orientation and landscape treatment respond sympathetically to the characteristics of the development site, its relationship with its immediate surroundings and, where appropriate, views into, over or out of the site; (2) its scale, form, height, massing, and proportions are compatible with the character of existing buildings, building lines, roofscapes and skylines; (3) it responds to locally characteristic architectural styles, rhythms, patterns, and detailing, taking account of their scale and proportions; (4) it incorporates high quality, durable and sustainable materials of an appropriate texture, colour, pattern and appearance that will contribute positively to the character of the area; (5) existing individual trees or tree groups that contribute positively to the area are retained; (6) adequate consideration has been given to the spaces between and around buildings to ensure that they are appropriate to their function, character, capacity and local climatic conditions; (7) any car parking or other servicing areas are appropriate to the context and sensitively located and designed so as not to dominate the public realm; (8) there will be no unacceptable adverse impact on the amenities of neighbouring properties in terms of privacy, outlook, daylight, sunlight, noise, odour, light intrusion, or activity levels; (9) major developments will promote permeable, accessible and easily understandable places by creating spaces that connect with each other, are easy to move through and have	No HRA implications. This is a general development management policy relating to design. There are no impact pathways present.

LPP2 Policy	Description	HRA Screening Outcome
	recognisable landmark features; (10) residential developments of 10 or more dwellings should demonstrate how the 'Building for Life 12' criteria have been taken into account and would be delivered by the development. Development of poor design that fails to take the opportunities available for improving the character and quality of an area and the way it functions will not be permitted.	
Policy DM26: Refuse and Recycling	Accessible, well-designed and easy to use waste and recycling facilities will be needed in new developments to help the Council meet its recycling targets. Refuse and recycling storage and collection facilities should be considered at the beginning of the design process in new development to ensure that: • Adequate refuse and recycling facilities are provided to serve the development. • Storage of wheelie bins, communal waste bins and refuse sacks do not detract from the street-scene, obstruct access or detract from residential amenity. • There is convenient access, both for occupiers of the properties and for the collection vehicles and workers.	No HRA implications. A development management policy providing criteria regarding new development and refuse and recycling provision. No HRA implications
Policy DM27: Landscape Design	Where appropriate, development proposals should demonstrate a high quality of landscape design, implementation and management as an integral part of the new development. Landscape schemes will be expected to: (1) reflect, conserve or enhance the character and distinctiveness of the local landscape or streetscape and integrate the development into its surroundings, adding visual interest and amenity; (2) encourage adaptation to climate change by, for example, providing areas to assist with flood mitigation or tree planting to assist with carbon capture and urban cooling; (3) retain and incorporate existing healthy mature trees and hedgerows and replace any trees that need to be removed with trees of an appropriate species; (4) where practicable, use material excavated from the site for re-contouring, infilling and	No HRA implications. This is a development management policy providing for high quality landscape design, implementation and management. There are no impact pathways present.

LPP2 Policy	Description	HRA Screening Outcome
	top-soiling, ensuring that any land re-modelling respects the local topographic character; (5) where appropriate, take opportunities to connect the development site to the existing green infrastructure network.	
Policy DM28: Residential Extensions	Extensions and alterations to dwellings will be permitted where the following criteria are met: (1) the materials and design, including the pitch, style and span of the roof, complement and enhance the character and appearance of the host building; (2) the design respects and responds positively to the scale, height, site coverage, bulk, massing and character of the adjacent properties and the wider street scene – in streets which have a definite architectural rhythm and similar style of dwelling, front extensions will not normally be acceptable; (3) two storey or second storey extensions at first floor level will normally be required to retain at least a one metre gap to the side boundary to prevent the creation of a 'terraced' appearance; (4) extensions would not result in unacceptable overlooking of, or loss of daylight to, the nearest habitable rooms or private amenity space of neighbouring dwellings. They should normally be restricted to within a line drawn from the mid-point of the nearest ground floor window of a habitable room of the neighbouring property. The line should be projected 60° for single storey extensions and 45° degrees for two storey extensions. Outside the planning boundaries, as defined on the Proposals Map, dwelling extensions will only be permitted where there would be no harmful impact on the surrounding landscape.	No HRA implications. A development management policy providing design criteria for residential extensions. It does not provide for new residential development. There are no impact pathways present.
Policy DM29: Garages and other buildings ancillary to existing dwellings	Where planning permission is required, garages and other buildings ancillary to an existing dwelling will be permitted where the following criteria are met: (1) the size, scale, siting and design relates satisfactorily to the existing dwelling and its curtilage, the established street scene, and the character of the locality; (2) the use of materials is sympathetic to the character and appearance of the existing dwelling.	No HRA implications This is a development management policy relating to planning permission for garages and other buildings ancillary to existing dwellings. There are no impact pathways present.

LPP2 Policy	Description	HRA Screening Outcome
	Outside the planning boundaries, as defined on the Proposals Map, garages and other ancillary domestic buildings should be subordinate in scale and proportion to, and located in close proximity to, the principal dwelling; the use of ancillary accommodation as a separate dwelling will not be permitted and proposals should not be of a size or design, or be capable of severance, to form an additional dwelling or dwellings.	
Policy DM30: Backland Development	Development in rear domestic gardens and other backland sites will be permitted where the following criteria are met: (1) the provision of safe and convenient vehicular access and parking which does not have an unacceptable adverse impact on the amenities of neighbouring properties in terms of noise, light or other disturbance; (2) the mass and scale of development will not have an overbearing impact on, or result in the loss of privacy to, existing homes and gardens; (3) the development does not cause the loss of trees, shrubs or other landscape features which make an important contribution to the character and appearance of the locality or its biodiversity.	No HRA implications Whilst this policy does imply development, it does not identify and quantum, location or type of development. This is a development management policy providing criteria relating to backland developments. There are no impact pathways present.
Policy DM31: Advertisements	Advertisements and signs will be permitted where they are sympathetic to the character and appearance of the location and/or the host building, having regard to size, design, colour, materials, construction, siting, level of illumination, and cumulative impact with other advertisements in the vicinity. Advertisements and signs will not be permitted where they would be detrimental to public safety or to the amenities of the area.	No HRA implications This is a development management policy relating to advertisements and signage. There are no impact pathways present.
Policy DM32: Telecommunications Infrastructure	The erection of telecommunications apparatus will be permitted where the following criteria are satisfied: (1) the apparatus uses an existing mast, building or other structure where practicable, without causing unacceptable harm to the appearance of any building or structure utilised; (2) where an existing mast, building or other structure is not available, the apparatus would be screened as far as practicable by the existing landform and trees, or by landscaping incorporated in the proposal;	No HRA implications. A development management policy providing criteria required for telecommunications infrastructure development. It does not identify and type or location of development. There are no impact pathways present.

LPP2 Policy	Description	HRA Screening Outcome
	(3) the apparatus would not have an adverse impact on a designated heritage asset or its setting; (4) the proposal incorporates appropriate materials or treatments for any associated buildings or supporting structures; (5) the potential for physical interference has been minimised in the siting and design of the apparatus. All proposals should include a landscape and visual assessment which will, where appropriate, show the impact of the proposal in the landscape and townscape or upon the setting of heritage assets, either in isolation or cumulatively with other nearby telecommunications related development.	
Policy DM33: Heritage Assets	Development affecting a heritage asset will be permitted where the proposal would make a positive contribution to conserving or enhancing the significance of the heritage asset, taking account of its character, appearance and setting. All development proposals that affect a heritage asset or its setting will be required to submit supporting information proportionate to the significance of the asset, including: (a) an assessment of the archaeological, architectural, historic or other significance of the affected asset, including any contribution made by its setting; (b) an assessment of the impact of the proposed development on the significance of the asset or its setting; (c) a statement of justification for the proposed development, together with details of any measures proposed to avoid, minimise or mitigate any harm to the significance of the asset. Where the loss of the whole or part of a heritage asset can be justified, the Council will seek, by a legal agreement and/or condition, to ensure that the new development will proceed within a reasonable timescale after the loss has occurred.	No HRA implications This is a development management policy relating to heritage assets. There are no impact pathways present.
Policy DM34: Areas of Established Character	Development within Areas of Established Character, as defined on the Proposals Map, will be permitted where it reflects the existing character of the area in terms of the gaps between buildings, building height, building size, site coverage, set-back from the street, boundary	No HRA implications This is a development management policy

LPP2 Policy	Description	HRA Screening Outcome
	treatments, mature trees, hedges and grass verges.	relating to areas of established character. There are no impact pathways present.
Tackling Climate Change		
Policy DM35: Footpath, Cycle and Bridleway Network	Development that would have a harmful impact on the convenience, safety or amenity value of the existing or proposed footpath, cycle or bridleway network will be permitted where this impact can be satisfactorily mitigated or an alternative facility of equivalent or improved quality would be delivered as part of the development.	No HRA implications. This is a development management policy that prevents harmful impacts to the footpath, cycle or bridleway network. Use of these methods of transport is positive in that it potentially reduces the use of motorised transport, thus reducing atmospheric pollution contributions from traffic. There are no impact pathways present.
Policy DM36: Station Parking	Development that would result in the permanent loss of public car parking spaces on sites adjacent to railway stations will not be permitted.	No HRA implications A development management policy relating to retention of station parking. There are no impact pathways present.
Policy DM37: Former Lewes to Uckfield Railway Line	Development that would significantly prejudice the reinstatement of the former Lewes to Uckfield railway line, as shown on the Policies Map, will not be permitted.	No HRA implications. This policy provides for the protection of the former Lewes to Uckfield railway line that does not prejudice future reinstatement. There are no impact pathways present.

4.8 The screening assessment of the DM policies undertaken in Table 2 identifies that the policy framework provided in the LPP2 could be screened out and is not considered to result in likely significant effects upon any European designated sites in isolation. This is in part because those policies that provide for either a type or location of development that *could* result in likely significant effects also provide for explicit protection of European designated sites within the policies themselves.

4.9 Additionally, LPP2 DM Policy DM24: (Protection of Biodiversity and Geodiversity) is a hook policy responsible for the overall protection of European designated sites, ensuring that likely significant effects do not occur as a result of development provided by LPP2. This policy states:

'Development which would be likely to adversely affect a designated Ramsar site, designated or candidate Special Area of Conservation (SAC) or a classified or potential Special Protection Area (SPA) will only be permitted where adverse likely significant effects can be avoided and/or mitigated against. After avoidance and mitigation measures have been considered, where residual adverse likely significant effects arise, development will only be permitted if there is no alternative solution and there are imperative reasons of over-riding public interest that would justify the development.

Development proposals that result in a net increase of one or more dwellings within 7km of the Ashdown Forest will only be permitted where they comply with Core Policy 10(3) of the Local Plan Part 1. The requirement of Core Policy 10 (3i) can be fulfilled through a contribution towards the management and monitoring of the Suitable Alternative Natural Greenspace (SANG) at Newick, as defined on the Proposals Map.'

5. Appropriate Assessment

5.1 The quantum of new residential development outlined in Table 4 of Lewes' LPP2 is in line with the adopted Joint Core Strategy Spatial Policy SP2. Table 4 of the LPP2 details that the levels of development required under the Joint Core Strategy have already been delivered or have been committed (as of April 2017). Additionally the LPP2 identifies residential development within Newick (which is located within 7 km of Ashdown Forest SPA and SAC). However, this development has already been allocated within the adopted (2015) Newick Neighbourhood Plan. With the provision of the Reedens Meadows SANG now in place, recreational pressure from new residential development within 7 km is not considered further in this report. It will clearly be important to monitor the success/take up of this SANG. It is understood that Lewes District Council's SANG tariff for management and monitoring will be published in the near future.

5.2 **Table 1** illustrates that LPP2 does not provide any residential allocations or quantum of residential development within settlements that are located within 7 km of Ashdown Forest SPA and SAC. However, the Newick Neighbourhood Plan does allocate sites within 7km of the Ashdown Forest SAC/SPA to deliver the quantum of development identified for Newick in the JCS. The data supporting the relevance of the 7km catchment to Lewes District have already been discussed. Although the Newick Neighbourhood Plan is now adopted, it is considered that for completeness the role of mitigation for that Neighbourhood Plan should be discussed in this appropriate assessment section, in the light of the Sweetman ruling.

5.3 There is a SANG which has been delivered specifically to serve the development at Newick. This is Reedens Meadows at Jackie's Lane and is now completed. Moreover, there is a mechanism for collecting contributions towards the SANG and for the SAMMS measures (in line with CP10 part 3). As such, the mitigation is in place to deliver the Newick Neighbourhood Plan allocations and as such there is no potential for likely significant effects stemming from an increase in recreational pressure in isolation or in combination.

5.4 LPP2 DM Policy DM24: (Protection of Biodiversity and Geodiversity) is a hook policy responsible for the overall protection of European designated sites, ensuring that likely significant effects do not occur as a result of development provided by LPP2. This policy states:

'Development which would be likely to adversely affect a designated Ramsar site, designated or candidate Special Area of Conservation (SAC) or a classified or potential Special Protection Area (SPA) will only be permitted where adverse likely significant effects can be avoided and/or mitigated against. After avoidance and mitigation measures have been considered, where residual adverse likely significant effects arise, development will only be permitted if there is no alternative solution and there are imperative reasons of over-riding public interest that would justify the development.

Development proposals that result in a net increase of one or more dwellings within 7km of the Ashdown Forest will only be permitted where they comply with Core Policy 10(3) of the Local Plan Part 1. The requirement of Core Policy 10 (3i) can be fulfilled through a contribution towards the management and monitoring of the Suitable Alternative Natural Greenspace (SANG) at Newick, as defined on the Proposals Map.'

6. Conclusion

6.1 Policy DM24 requires specific protection for Ashdown Forest SAC/SPA by requiring all net new housing within 7km of the SAC/SPA to contribute to mitigation (management and monitoring of SANG). The SANG on which this development relies has already been delivered. As such it is possible to conclude that there will be no adverse effects on the integrity of any European sites due to growth in Local Plan Part 2, either alone or in combination with other plans and projects.

Limitations

AECOM Infrastructure & Environment UK Limited ("AECOM") has prepared this Report for the sole use of the South Downs National Park Authority and Lewes District Council ("Client") in accordance with the Agreement under which our services were performed. No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by AECOM. This Report is confidential and may not be disclosed by the Client nor relied upon by any other party without the prior and express written agreement of AECOM.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate. Information obtained by AECOM has not been independently verified by AECOM, unless otherwise stated in the Report.

The methodology adopted and the sources of information used by AECOM in providing its services are outlined in this Report. The work described in this Report was undertaken between summer 2017 and April 2018 and is based on the conditions encountered and the information available during the said period of time. The scope of this Report and the services are accordingly factually limited by these circumstances.

Where assessments of works or costs identified in this Report are made, such assessments are based upon the information available at the time and where appropriate are subject to further investigations or information which may become available.

AECOM disclaim any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to AECOM's attention after the date of the Report.

Certain statements made in the Report that are not historical facts may constitute estimates, projections or other forward-looking statements and even though they are based on reasonable assumptions as of the date of the Report, such forward-looking statements by their nature involve risks and uncertainties that could cause actual results to differ materially from the results predicted. AECOM specifically does not guarantee or warrant any estimate or projections contained in this Report.

1 Executive Summary

1.1.1 In March 2017 a High Court judgment against the adopted Lewes/South Downs Joint Core Strategy (JCS)[1] concluded that the method that had been used in the JCS Habitat Regulations Assessment to rule out the potential for 'in combination' air quality effects from their plan on Ashdown Forest SAC was legally flawed, whether or not it complied with advice the Council had been given by Natural England, because it relied entirely on examining the flows arising from the JCS in isolation and took no account of the potential accumulation of growth from multiple authorities all affecting vehicle flows through the SAC, and the role (or not) of the JCS in any cumulative effect. In layman's terms, because the JCS used a shorthand assessment method agreed with Natural England, the HRA of the JCS *asserted* that its contribution was too small to contribute meaningfully to any 'in combination' effect but did not *demonstrate* that conclusion since it did not attempt to quantify the 'in combination' effect or demonstrate what the contribution of the JCS would actually mean in terms of changes in air quality.

1.1.2 In September 2017 AECOM undertook an air quality impact assessment for Lewes District Council and South Downs National Park Authority, which modelled forecast traffic growth on key roads within 200m of Ashdown Forest SAC over the period 2017 to 2033, including that expected due to the quantum and distribution of growth in the adopted Lewes Joint Core Strategy (as it relates to Lewes District outside the South Downs National Park) and the South Downs Local Plan. Tunbridge Wells Borough Council commissioned AECOM to use the same traffic and air quality models to undertake an identical analysis for the emerging Tunbridge Wells Local Plan. Sevenoaks District Council also commissioned an analysis. This report presents the results of the updated modelling including the detailed modelling of growth in Lewes, Tunbridge Wells and Sevenoaks. In order to address comments made during the consultation on the Local Plan and its HRA, the modelling work also includes consideration of ammonia emissions. It therefore replaces and supersedes the previously published addendum to the 2017 South Downs Local Plan (and Lewes JCS) HRA in its entirety. However, its overall conclusion does not undermine and is similar to that of the previous Addendum.

1.1.3 Forecast vehicle flows on roads through Ashdown Forest in 2033 are compared with baseline flows on the same roads in order to ascertain the air quality effect. The relative contribution of growth in South Downs Local Plan/Lewes Joint Core Strategy (JCS) is then separated out from growth in other authorities in order to establish the relative contribution of the South Downs Local Plan/Lewes JCS to any change in air quality by 2033.

1.1.4 In summary, the analysis concludes that ammonia concentrations at the closest areas of heathland to affected roads (5m from the A275 and A22) are below 1 μm^{-3} and nitrogen deposition rates along all links are forecast to experience a net improvement of 1.6-1.9 kgN/ha/yr by 2033, even allowing for traffic growth, due to improvements in NOx emission factors and background concentrations/deposition rates over the same timetable. The maximum 'in combination' additional nitrogen deposition forecast to the nearest areas of heathland by 2033 is 0.3 kgN/ha/yr. Based on published research into dose-response relationships in heathland this would be c. 25% of the nitrogen 'dose' that might result in a significant retardation of any improvement in species richness that might otherwise be observed at the forecast background deposition rates and is not expected to result in a significant change in grass cover. Moreover, the contribution of the South Downs Local Plan/JCS is negligible, being a maximum 0.07 kgN/ha/yr at the roadside of the A275.

1.1.5 Furthermore, the Local Plan and Joint Core Strategy both contain sustainability policies (notably Local Plan policy SD19 (Transport and Accessibility) and Joint Core Strategy policy 13 (Sustainable Travel)) which are not factored into these traffic/air quality calculations and aspects of which have some potential to reduce the need for journeys to work by private vehicle towards Ashdown Forest; thus further reducing the already small contribution to increased vehicle movements on the A26 that is forecast to arise from the Local Plan and JCS.

1.1.6 Although it does not constitute mitigation (and is not presented as such), as a further safeguard the South Downs National Park Authority has also convened an Ashdown Forest Working Group

[1] Wealden District Council vs Secretary of State for Communities and Local Government. Lewes District Council and South Downs National Park Authority and Natural England. [2017] EWHC 351 (Admin)

which first met in April 2017. The shared objective of the working group is to ensure that impacts on the Ashdown Forest are properly assessed through HRA and that, if required, a joint action plan is put in place should such a need arise. It should be noted that the absence of any need for 'mitigation' associated with the scale of future growth in a particular authority does not prevent the Ashdown Forest authorities cooperatively working together to do whatever they jointly consider appropriate in reducing traffic and improving nitrogen deposition etc. around the Forest as a matter of general good stewardship, at least until 2040 after which it is likely an improvement in road-related air quality will start to be realised due to the Government's announcement to ban the sale of new petrol and diesel vehicles at that point. The aforementioned working group would be a suitable forum.

2 Introduction

2.1.1 Ashdown Forest is an extensive area of common land lying between East Grinstead and Crowborough entirely within Wealden District. The soils are derived from the predominantly sandy Hastings Beds. It is one of the largest single continuous blocks of heath, semi-natural woodland and valley bog in south-east England, and it supports several uncommon plants, a rich invertebrate fauna, and important populations of heath and woodland birds. It is both a Special Area of Conservation (SAC) and Special Protection Area (SPA)

2.1.2 The SPA is designated for its populations of breeding Dartford Warbler *Sylvia undata* and Nightjar *Caprimulgus europaeus*. The SAC is designated for its Annex I habitats, namely Northern Atlantic wet heaths with *Erica tetralix* and European dry heaths; as well as for its Annex II species, namely Great Crested Newts.

2.1.3 Exhaust emissions from vehicles are capable of adversely affecting the protected heathland found in Ashdown Forest. Accordingly, in September 2017 AECOM undertook an air quality impact assessment for Lewes District Council and South Downs National Park Authority, which modelled forecast traffic growth on key roads within 200m of Ashdown Forest SAC over the period 2017 to 2033, including that expected due to the quantum and distribution of growth in the adopted Lewes Joint Core Strategy (as it relates to Lewes District outside the South Downs National Park) and the South Downs Local Plan. Tunbridge Wells Borough Council commissioned AECOM to use the same traffic and air quality models to undertake an identical analysis for the emerging Tunbridge Wells Local Plan. Sevenoaks District Council also commissioned an analysis. This report presents the results of the updated modelling including the detailed modelling of growth in Lewes, Tunbridge Wells and Sevenoaks. In order to address comments made during the consultation on the Local Plan and its HRA, the modelling work also includes consideration of ammonia emissions. It therefore replaces and supercedes the previously published addendum to the 2017 South Downs Local Plan HRA in its entirety. However, its overall conclusion is similar to that of the previous Addendum.

2.1.4 The methodology used in this analysis is compliant with the requirement of the Conservation of Habitats and Species Regulations 2017 to consider whether an adverse effect on the integrity of a European site will result either alone, or in combination with other plans and projects.

2.1.5 In addition to determining the total cumulative ‘in combination’ effect on roadside air quality at Ashdown Forest SAC, the calculations presented in this analysis also consider the contribution of South Downs Local Plan and the Lewes Joint Core Strategy to that ‘in combination’ effect. This is necessary to determine whether the contribution is ecologically material and thus whether mitigation of that contribution is required.

3 Methodology

3.1.1 Vehicle exhaust emissions generally only have a local effect within a narrow band along the roadside, within 200m of the centreline of the road. Beyond 200m emissions are considered to have dispersed sufficiently that atmospheric concentrations are essentially background levels. The rate of decline is steeply curved rather than linear. In other words concentrations will decline rapidly as one begins to move away from the roadside, slackening to a more gradual decline over the rest of the distance up to 200m.

3.1.2 There are two measures of particular relevance regarding air quality impacts from vehicle exhausts and which are modelled using standard forecasting. The first is the concentration of oxides of nitrogen (known as NOx) in the atmosphere. In extreme cases NOx can be directly toxic to vegetation but its main importance is as a source of nitrogen, which is then deposited on adjacent habitats. The guideline atmospheric concentration advocated by Government for the protection of vegetation is 30 micrograms per cubic metre (μgm^{-3}), known as the Critical Level, as this concentration relates to the growth effects of nitrogen derived from NOx on vegetation.

3.1.3 The second important metric is a measure of the rate of the resulting nitrogen deposition. The addition of nitrogen is a form of fertilization, which can have a negative effect on heathland and other habitats over time by encouraging more competitive plant species that can force out the less competitive species that are more characteristic. Unlike NOx in atmosphere, the nitrogen deposition rate below which we are confident effects would not arise is different for each habitat. The rate (known as the Critical Load) is provided on the UK Air Pollution Information System (APIS) website (www.apis.ac.uk) and is expressed as a quantity (kilograms) of nitrogen over a given area (hectare) per year ($kgNha^{-1}yr^{-1}$).

3.1.4 A third pollutant included in this assessment is ammonia emissions from traffic. In ecological terms ammonia differs from NOx in that it is not only a source of nitrogen but can also be directly toxic to vegetation in relatively low concentrations. Using the process set out in Design Manual for Roads and Bridges, ammonia emissions for traffic are not normally calculated. However, for completeness, and in response to representations made by Wealden District Council, they have been included in this iteration of AECOM's modelling, both in terms of atmospheric concentrations and as a source of nitrogen.

3.1.5 Finally, and for completeness, rates of acid deposition have also been calculated. Acid deposition derives from both sulphur and nitrogen. It is expressed in terms of kiloequivalents (keq) per hectare per year. The thresholds against which acid deposition is assessed are referred to as the Critical Load Function. The principle is similar to that for a nitrogen deposition Critical Load but it is calculated very differently.

3.2 Traffic modelling

3.2.1 A series of road links within 200m of Ashdown Forest Special Area of Conservation (SAC) were identified for investigation. These links were chosen as they are all representative points on the busiest roads through the SAC and are also the roads likely to experience the greatest increase in flows over the period to 2033. As such, these are the roads where an air quality effect due to additional traffic growth is most likely to be observed.

3.2.2 Traffic data were generated for each of these links for three scenarios, described in this report as:

- Base Case
- Do Nothing (DN)
- Do Something (DS)

3.2.3 The Base Case uses measured flows, percentage Heavy Duty Vehicles (HDVs) and average vehicle speeds on the relevant links, as provided by Wealden District Council (WDC). The Wealden traffic counts were for 2014 (either undertaken in that year, or adjusted to that year). For the purposes of consistency with wider traffic modelling used to inform the Habitat Regulations Assessment (HRA) of the South Downs Local Plan, which use measured traffic

counts from 2017, these data were 'grown' by AECOM transport planners to 2017. Since the emerging Sevenoaks Local Plan is backdated to 2015, the emerging South Downs Local Plan and emerging Tunbridge Wells Local Plan to 2014 and the Joint Core Strategy to 2010, this means that housing and employment development that has been delivered and occupied prior to 2017 is allowed for in the measured baseline flows. However, this is also true for all other local authorities, so there is no disparity in treatment of local authorities in the modelling. Development that has been consented but not actually completed/occupied does not appear in the baseline flows.

3.2.4 The Do Nothing scenario is the term used in this report to describe the future flows on the same roads at the end of the South Downs Local Plan period (2033), without consideration of the role of the Tunbridge Wells Local Plan, South Downs Local Plan, Sevenoaks Local Plan or Lewes Joint Core Strategy. This therefore presents the expected contribution of other plans and projects to flows by 2033, outside these four authorities. The end of the Local Plan period has been selected for the future scenario as this is the point at which the total emissions due to Tunbridge Wells Local Plan/Sevenoaks Local Plan/South Downs Local Plan/JCS traffic will be at their greatest. The scenario is calculated by extrapolating the observed traffic data. The Do Nothing scenario adds all traffic growth from 2017 to 2033 that will result in additional journeys on the modelled road links.

3.2.5 For the purposes of 'in combination' assessment (i.e. incorporating growth into the model due to multiple Local Plans and Core Strategies for surrounding authorities) it was decided that modelling the adopted Local Plans directly would not reflect actual housing growth in those authorities between 2017 and 2033 because:

1. Since most commence in 2006 they include a large number of allocations that are historic (i.e. already delivered and occupied) and these are already part of the measured base flows.
2. Adopted plans for these authorities may not accurately reflect growth over the period 2017 to 2033 because, with the exception of Lewes Joint Core Strategy, all the adopted plans for the boroughs/districts immediately around Ashdown Forest SAC finish seven years before the South Downs Local Plan, which runs to 2033 whereas the adopted plans (other than the Lewes JCS) all run to 2026 or 2027. This means that there will be 6-7 years of growth which is not covered by most adopted plans.

3.2.6 Expected development in these authorities over the period 2017 to 2033 was therefore included in the model by using the National Trip End Model Presentation Program (TEMPRO). TEMPRO produces a growth factor that is applied to the measured flows. It is based on data for each local authority district in the UK (distributed by statistical Middle Layer Super Output Area[2]) regarding future changes in population, households, workforce and employment (in addition to data such as car ownership) but is not limited to a given period of time. Traffic growth factors are utilised for the statistical Middle Layer Super Output Areas (MSOAs) within which the modelled links are located. TEMPRO has the advantages of being forecastable to 2033 and beyond, using growth assumptions that are regularly updated and distributed to the level of Middle-Layer Super Output Area (of which there are 21 in Wealden District alone) and of being an industry standard database tool across England meaning that modelling exercises that use TEMPRO will have a high degree of consistency.

3.2.7 The other authorities immediately surrounding Ashdown Forest are those in which development is most likely to influence annual average daily traffic flows through the SAC. For those authorities (Wealden, Mid-Sussex and Tandridge) scrutiny of the relevant adopted Local Plans or Core Strategies and the associated housing growth rates in TEMPRO resulted in the conclusion that the adopted plans (and TEMPRO) may currently underestimate growth to 2033 and this could in turn materially affect the estimation of 2033 AADT flows on the relevant roads. The decision was therefore made to raise the growth allowances for these authorities to reflect their most recent Objectively Assessed Need (OAN) at time of traffic modelling[3]. The OAN figure was

[2] Middle Layer Super Output Areas are a geographical hierarchy designed to improve the reporting of small area statistics in England and Wales. They are a series of areas each of which has a minimum population of 5,000 residents. They have a mean population of 7,200 residents.

[3] Note that the Objectively Assessed Need figures in the Do Nothing component of the model date from June 2017. For Wealden District this broadly matches the growth rates that authority has used in its own modelling. In September 2017 the Government released a new Objectively Assessed Housing Need for each local authority. Other than Tunbridge Wells and Sevenoaks (whose elevated OAN is taken into account in this updated modelling), only 1 of the relevant authorities has a higher OAN using the Government method than the figure used in the previous Do Nothing modelling: Tandridge's OAN increases from 470 to 645. On the other hand, two of the authorities modelled in Do Nothing have OAN's lower than those used in the model (Wealden and Mid-Sussex). Therefore, given that the Government method is still out to

derived from published information released by the Councils themselves or (in the case of Mid-Sussex) by their Local Plan inspector. Although housing growth rates were adjusted upwards, expected broad housing distributions were not altered. Employment growth assumptions in TEMPRO for these authorities were not adjusted. The authorities and their quanta and broad distributions of housing growth as considered in our analysis are as follows:

- **Wealden** – Adopted Local Plan Core Strategy Policy WCS1 specifies delivery of 4,525 dwellings over the period 2010 to 2027 (266 per annum). A new draft Local Plan has been consulted upon but is currently being updated and revised. Growth in Uckfield and Crowborough (as well as smaller settlements around the SAC such as Maresfield) is most likely to affect flows through the SAC, although development across the district is likely to contribute cumulatively. At Uckfield '*The* [adopted] *Local Plan will allow for a redevelopment of the towns retail centre providing some 10,000 m² of new retail space as well as the creation of 12,650 m² of employment space. It limits to 1000 the number of new homes to be built between now and 2027, and identifies Ridgewood as the most sustainable place for the growth needed to support the vibrancy of the town'*.[4] The main focus of growth at Uckfield is an urban extension to the west of the town. At Crowborough: '*Wealden's* [adopted] *Core Strategy Local Plan, approved in 2012, allows for a significant amount of new housing in Crowborough, with supporting office space and commercial premises within the town at appropriate locations. It will see some 450 new houses built in existing settlements across Wealden each year up until 2027… Within Crowborough the Local Plan allows for some 140 new homes to be built in the town at Pine Grove and Jarvis Brook. It also allows for 160 new homes to be built in an urban extension to the south east of the town.'*[5] The most recent Objectively Assessed Need for Wealden is 832 dwellings per annum. Since this is a substantial difference from that in the published Core Strategy the higher rate was used in the model, although it is accepted that this may overestimate the scale of growth that the next iteration of Wealden Local Plan actually proposes for the district.

- **Mid-Sussex** – The submitted Local Plan (2014 – 2031) plans for 13,600 dwellings (800 dwellings per annum). A large part of the housing and employment development is intended to consist of a new strategic development (3,500 dwellings) north of Burgess Hill, 13km south-west of the SAC, as well as existing commitments in that same settlement. The submitted plan also proposes 600 dwellings at Pease Pottage, 12km west of the SAC and smaller levels of growth elsewhere. Housing in East Grinstead (and to a lesser extent Haywards Heath) is most likely to be relevant to flows through Ashdown Forest as East Grinstead lies on the A22 approximately 4km north of the SAC. These are both Category 1 settlements in the Local Plan's hierarchy and can therefore be expected to take a sizeable proportion of the dwellings expected to be allocated 'elsewhere in the district' over the plan period according to policy DP5. During the plan's Examination in Public, the Inspector identified in February 2017 that he was minded to increase the growth rate from 800 per annum to 1,026 per annum. Although it is now understood that number may be reduced, the 1,026 figure has been used in this analysis to be precautionary.

- **Tandridge** – The adopted Core Strategy expects 2,500 dwellings from 2006 to 2026 at an average rate of 125 dwellings per annum. The majority of development will take place within the existing built up areas of Caterham, Warlingham, Whyteleafe, Oxted and Hurst Green. The new Local Plan is in the early stages of development (broad strategy published in March 2017 but no information on detailed scale or location of growth) with a forthcoming Garden Village consultation in autumn 2017. The most recent Objectively Assessed Need for Tandridge at the time the traffic modelling was undertaken was 470 dwellings per annum. Since this is a substantial difference from that in the published Core Strategy the higher rate was used in the model as a precaution, although it is accepted that the level of growth in the final Local Plan for Tandridge may be less than this number. Tandridge are currently

consultation, and for consistency with the previous Lewes/South Downs work, the housing growth rates for Tandridge, Mid-Sussex and Wealden have been left as per the original South Downs/Lewes model.

[4] http://www.wealden.gov.uk/Wealden/Residents/Planning_and_Building_Control/Planning_Policy/CoreStrategy/Planning_Core_Strategy_Uckfield.aspx (accessed 05/09/17)

[5] http://www.wealden.gov.uk/Wealden/Residents/Planning_and_Building_Control/Planning_Policy/CoreStrategy/Planning_Core_Strategy_Crowborough.aspx (accessed 05/09/17)

considering the location of a new Garden Village but the location is not determined at this point and therefore no specific location for this Garden Village was included in the modelling.

3.2.8 The Do Nothing (and thus Do Something) Scenario is therefore intentionally precautionary and allows for growth over the period to 2033 beyond that in adopted (or even published draft) Local Plans in those authorities immediately surrounding Ashdown Forest SAC. Both scenarios assume a consistent rate of housing delivery over the plan period. It is understood that a Statement of Common Ground is being produced between the various authorities around Ashdown Forest and included in that SoCG are detailed proposals for future modelling regarding traffic numbers that should be assumed. However, that agreement is still in progress and the traffic modelling used in this report was undertaken before that aspect of the agreement was devised. Therefore, this modelling may overestimate growth rates in some authorities, particularly Mid-Sussex District.

3.2.9 TEMPRO provides a consistent and standard approach to traffic forecasting when a large number of sources (e.g. local authority areas) are involved. However, a more nuanced forecast can be obtained by creating a bespoke model that manually distributes trips according to journey to work data. This approach provides a better understanding of where traffic associated with the proposed Local Plan development is likely to be most concentrated. Tunbridge Wells Borough Council, Lewes District, Sevenoaks District Council and South Downs National Park Authority therefore commissioned AECOM to create a bespoke model for their authorities.

3.2.10 The bespoke modelling exercise adds traffic in the aforementioned four local authority plans into the existing Do Nothing modelling to create the Do Something scenario. Since the original modelling undertaken for the National Park Authority in autumn 2017 only added South Downs National Park and Lewes JCS to create the Do Something scenario (leaving the other authorities in Do Nothing) this (March 2018) modelling therefore supercedes that earlier modelling exercise and the Do Nothing and Do Something flows are different to those reported in that earlier document. The 2033 Do Something scenario reported in this document includes bespoke modelling for Lewes District, Sevenoaks District, South Downs National Park and Tunbridge Wells Borough, although the relative contribution of South Downs National Park/Lewes JCS to that Do Something forecast is identifiable.

3.2.11 The Do Something scenario reflects the combined role of the Tunbridge Wells Local Plan, Sevenoaks Local Plan, South Downs Local Plan, Lewes Joint Core Strategy and subsidiary Neighbourhood Plans by 2033, in addition to growth in other authorities. Detailed modelling of Local Plan/Neighbourhood Plan growth locations undertaken by the AECOM transport planning team was added to the adjusted TEMPRO growth for all other authorities. To build the Local Plan model, housing and employment sites in Tunbridge Wells, Sevenoaks District, Lewes District and the National Park (allocations in the Local Plan, Joint Core Strategy, allocations in Neighbourhood Plans, unimplemented planning permissions and windfall) were geographically assigned to 'distribution groups' across Tunbridge Wells Borough, Sevenoaks District, the National Park and Lewes District using GIS software. The distribution of each of these groups was calculated using Census 2011 journey to work data, and the trips associated with each distribution group then manually assigned across the network.

3.2.12 The 'in combination' growth scenario is therefore the Do Something flows, as these include existing traffic, all future journeys arising from within Tunbridge Wells Borough, the South Downs National Park, Sevenoaks District and Lewes District due to the Local Plan, Joint Core Strategy or Neighbourhood Plan proposals (from AECOM's model), and future traffic arising from all other authorities (from TEMPRO, adjusted for expected higher growth rates in some authorities). The difference between the Do Something scenario and the Do Nothing scenario illustrates the role of the Tunbridge Wells Local Plan, Sevenoaks Local Plan, JCS and South Downs Local Plan (and Neighbourhood Plans) in changing future flows compared to what would be expected without the Local Plan/Joint Core Strategy proposals.

3.3 Air quality calculations

3.3.1 Using these scenarios and information on total traffic flow, average vehicle speeds and percentage Heavy Duty Vehicles (which influence the emissions profile), AECOM air quality specialists calculated expected NOx concentrations, nitrogen deposition rates, ammonia concentrations and acid deposition rates at receptor points along each modelled road link. The predictions for NOx and nitrogen deposition are based on the assessment methodology presented in Annex F of the Design Manual for Roads and Bridges (DMRB), Volume 11, Section

3, Part 1 (HA207/07)[6] for the assessment of impacts on sensitive designated ecosystems due to highways works[7]. Background data for NOx and NO_2 were sourced from the Department of Environment, Food and Rural Affairs (Defra) background maps[8]. Background data for ammonia was sourced from monitoring undertaken at Ashdown Forest[9].

3.3.2 The DMRB does not provide a method for forecasting ammonia emissions from traffic. A method has therefore been devised for this modelling. The methodology for this is presented in detail in Appendix D. The research undertaken in Ashdown Forest indicates that beyond 20m from the roadside ammonia contributions are expected to tend towards background and so the contribution of road sources would be limited beyond this point.

3.3.3 Given that the assessment year (2033) is a considerable distance into the future, it is important for the air quality calculations to take account of improvements in background air quality and vehicle emissions that are expected nationally over the plan period. Making an allowance for a realistic improvement in background concentrations and deposition rates is in line with the Institute of Air Quality Management (IAQM) position[10] as well as that of central government[11]. Background nitrogen deposition rates were sourced from the Air Pollution Information System (APIS) website[12]. Although in recent years improvements have not kept pace with predictions, the general long-term trend for NOx has been one of improvement (particularly since 1990) despite an increase in vehicles on the roads[13]. There is also an improving trend for nitrogen deposition, although the rate of improvement has been much lower than for NOx[14]. The current DMRB guidance for ecological assessment suggests reducing nitrogen deposition rates by 2% each year between the base year and assessment year. However, due to some uncertainty as to the rate with which projected future vehicle emission rates and background pollution concentrations are improving, the precautionary assumption has been made in this assessment that not all improvements projected by DMRB (for nitrogen deposition) or Defra (for NOx concentrations) will occur. With regards to background ammonia concentrations; as there is greater uncertainty associated with rates of improvement over time, background concentrations have been kept the same through all assessment years.

3.3.4 Therefore, the air quality calculations assume that conditions in 2023 (an approximate midpoint between the base year and the year of assessment) are representative of conditions in 2033 (the year of assessment). The effect on the 2033 data is equivalent to assuming a 0.75% per annum improvement in background NOx concentrations and nitrogen deposition rates between 2017 and 2033. The approach of not assuming all projected improvements occur (known as Gap Analysis) is accepted within the professional air quality community and accounts for known recent improvements in vehicle technologies (new standard Euro 6/VI vehicles), whilst excluding the more distant and therefore more uncertain projections on the evolution of the vehicle fleet. No discussion is made in this analysis of the UK Government's recent decision to ban the sale of new petrol and diesel vehicles from 2040 since it would not affect the time period under consideration, but that announcement illustrates the general long-term direction of travel for roadside air quality in the UK and underlines that allowing for improvements in both vehicle emissions factors and background rates of deposition over long timescales is both appropriate and realistic.

3.3.5 Annual mean concentrations of NOx were calculated at varied intervals back from each road link up to a maximum of 200m, with the closest distance being the closest point of the designated site to the road. Predictions were made using the latest version of ADMS-Roads using emission rates derived from the Defra Emission Factor Toolkit (version 8.0.1) which utilises traffic data in the form of 24-hour Annual Average Daily Traffic (AADT), %HDV and average speed. The tables in

[6] Design Manual for Roads and Bridges, HA207/07, Highways Agency

[7] DMRB advocates a nitrogen deposition velocity of 0.1 cms^{-1} for non-woodland vegetation and that velocity is therefore used in AECOMs modelling.

[10] http://www.iaqm.co.uk/text/position_statements/vehicle_NOx_emission_factors.pdf

[11] For example, The UK Government's recent national Air Quality Plan also shows expected improvements over the relevant time period (up to 2030) https://www.gov.uk/government/publications/air-quality-plan-for-nitrogen-dioxide-no2-in-uk-2017

[12] Air Pollution Information System (APIS) www.apis.ac.uk

[13] Emissions of nitrogen oxides fell by 69% between 1970 and 2015. Source: https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/579200/Emissions_airpollutants_statisticalrelease_2016_final.pdf [accessed 08/06/17]

[14] Total nitrogen deposition (i.e. taking account of both reduced and oxidised nitrogen, ammonia and NOx) decreased by 13% between 1988 and 2010. This is an improvement of 0.59% per annum on average.

Appendix A present the calculated changes in NOx concentration, nitrogen deposition and acid deposition 'in combination' (i.e. the difference between Do Something and the 2017 Base case) and the role played by Local Plan/Joint Core Strategy development compared to that which would occur in any case over the plan period (i.e. the difference between Do Something and Do Nothing).

Model verification

3.3.6 To assist in the verification of the AECOM model (produced December 2017) AECOM were provided with a partially redacted version of a report prepared for Wealden District Council by Air Quality Consultants ('AQC') (Ashdown Forest SAC, Air Quality Monitoring and Modelling, December 2017). This report provided grid references, distance to road (m) and NO2/NOX concentrations for a number of measurement locations. The measurement height of these diffusion tubes was not recorded in the AQC report and this has been taken as 2m to match the stated height of the Ammonia ALPHA samplers, which are also included within this report.

3.3.7 Using these diffusion tube data AECOM was able to model the latest version of the Ashdown Forest model (December 2017) which uses 2017 backgrounds based on the base year 2015 and the NO_x to NO_2 Calculator v6.1 for 2017 using All non-urban UK traffic for the local authority of Wealden.

3.3.8 This verification process calculated a model adjustment factor of 2.73[15] with an RMSE of 4.2. The RMSE should ideally be within 10% of the relevant air quality criterion, but is acceptable where it is within 25% of the relevant air quality criterion, as is the case here[16].

[15] This adjustment factor (2.73) is higher than the main factors produced by AQC in their report. The modelling approach taken by AQC includes canyoning effects, time-varying emission profiles, CURED emission rates, terrain data and incorporates the effects of road gradient on NO_X emissions all of which may increase concentrations within close proximity to the road source where the verification diffusion tubes are located. It is also noted that the tube height of 2m is an assumption which would affect the overall factor if the tubes are at a different height.

4 Results

4.1 Traffic modelling

4.1.1 The flows forecast by 2033, and how these differ between Do Nothing (without the Local Plans/JCS) and Do Something (*including* the Sevenoaks, Tunbridge Wells and South Downs Local Plans and the Lewes JCS) are presented overleaf.

Table 1. Traffic flow data used in the air quality modelling

A	B	C	D	E	F	G	H
Link ID	Link Description	Wealden Model Base 2014 AADT	2017 Base AADT	2033 DN AADT (traffic growth excluding Sevenoaks, Lewes, South Downs and Tunbridge Wells Local Plans)	2033 DS AADT (traffic growth including Sevenoaks, Lewes, South Downs and Tunbridge Wells Local Plans)	Difference between 2017 Base and DS (i.e. net traffic growth from 2017 to 2033)	Difference between DS and DN
6	A22 Royal Ashdown Forest Golf Course	11,480	11,509	12,887	13,167	1,658	280
33	A22 Wych Cross	12,340	12,371	13,852	14,009	1,638	157
34	A22 Nutley	11,360	11,389	12,752	12,915	1,526	163
37	A275 Wych Cross	4,530	4,542	5,085	5,413	871	328
38	A26 Poundgate	16,150	16,191	18,129	19,205	3,014	1,076

Table 2. Breakdown of Do Something scenario to show the relative contributions of South Downs Local Plan/Lewes JCS to the change in flows between 2017 and 2033, expressed as AADT and as percentage contribution to the difference between DS and DN

Link ID	South Downs Local Plan/Lewes JCS (AADT)
6	192 (69%)
33	69 (44%)
34	75 (46%)
37	237 (72%)
38	380 (35%)

The percentages in Table 2 can be applied to the difference between DS and DN in Appendix 1 to determine the relative contribution of the Local Plan to ammonia, NOx, nitrogen deposition and acid deposition.

4.1.2 All links are forecast to experience an increase in traffic flows between 2017 and 2033 when all expected traffic growth sources (including the Tunbridge Wells Local Plan, Sevenoaks Local Plan, South Downs Local Plan, and Lewes JCS) are taken into account (Column G of Table 1). Note that this traffic growth can be expected to occur incrementally over the plan period, matching the housing delivery trajectory.

4.2 Air quality calculations

Ammonia

4.2.1 Ammonia concentrations in atmosphere are discussed in this section. Ammonia as a source of nitrogen is discussed in the following section on nitrogen deposition.

4.2.2 There are two critical levels for ammonia in atmosphere, which represent the differing sensitivities of lower plants (lichens and mosses) and higher plants (all other vegetation) to the gas. The difference is because higher plants have a protective cuticle which makes them less vulnerable to the gas than lower plants. A judgment must be made over which is more appropriate in a given location. The lower critical level (1 μm^{-3}) is only appropriate to use in an HRA where the affected area within the modelled transect has a high lichen/bryophyte interest that is relevant to the integrity of the SAC habitat. Otherwise the higher critical level (3 μm^{-3}) is more appropriate. If concentrations are forecast to be below the critical level within the relevant part of the SAC then there is good reason to conclude no adverse effect will arise.

4.2.3 Heathlands can support a diverse terricolous lichen flora provided the sward is sufficiently open for colonisation. All heathland SACs therefore automatically have the lower critical level assigned to them on the UK Air Pollution Information System (www.apis.ac.uk) and APIS makes it clear that this is due to an *a priori* assumption of lichen/bryophyte interest somewhere in the site. However, APIS assigns critical levels to SACs fairly generically rather than basing the decision on location specific data. In practice there are many areas of heathland that do not support a diverse lichen flora, since management is very significant in influencing lichen diversity and abundance and closed dense swards are much less likely to support a terricolous lichen community than more open swards. In such cases the higher critical level of 3 μm^{-3} is a more appropriate reference threshold.

4.2.4 Some parts of Ashdown Forest SAC do support a diverse terricolous heathland lichen assemblage. However, Wealden District Council has produced habitat maps using Earth Observation (satellite imagery and airborne systems) and commissioned site vegetation surveys[17]. None of these data indicate the presence of a significant assemblage of terricolous heathland lichens adjacent to any of the modelled roads[18] and such an assemblage would not be expected in these areas given the tall dense swards (including a high proportion of bracken, scrub and trees). This has been verified by site inspections undertaken by AECOM. Even in heathland that is not scrub and bracken encroached, diverse lichen assemblages will generally only occur where the sward is managed to keep it open to control dwarf shrub (i.e. heather) cover. As such, the higher critical level is considered more appropriate for the relevant roadside locations at Ashdown Forest SAC.

4.2.5 Bearing that in mind, modelling undertaken by Air Quality Consultants Ltd for Wealden District Council indicates that the 3 μm^{-3} critical level for these specific roadside locations is not exceeded and is not forecast to be exceeded. This is supported by AECOM's modelling (Appendix A). Therefore, using this critical level, no direct toxicity effects of ammonia are expected on the key habitats of the SAC, whether associated with traffic emissions or other sources such as agriculture.

4.2.6 Nonetheless, for completeness, Table 3 below summarises the ammonia concentration results for each link with reference to whether the lower critical level (1 μm^{-3}) is forecast to be exceeded at the nearest area of heathland based on AECOM modelling.

[17] Two interim ecological survey reports have been released so far, the most recent dated May 2016. These are available at http://www.wealden.gov.uk/Wealden/Residents/Planning_and_Building_Control/Planning_Policy/Evidence_Base/Planning_Evidence_Base_Habitat_Regulations_Assessment.aspx

[18] Paragraph 3.3.2 of the 2015 interim botanical survey report for Ashdown Forest states that '*Varying amounts of bryophytes and lichens were recorded, with Cladonia present in some areas but not particularly prevalent along transects'.*

Table 3. Summary of ammonia results for the nearest areas of heathland to each modelled link, with reference to the 1 μm^{-3} critical level for ammonia

Link/Transect	Nearest area of heathland	Summary of results by reference to the 1 μm^{-3} critical level
Transect 38: A26 at Poundgate	Approximately 45m from the road, although most is more distant. Intervening habitat is woodland.	2033 ammonia concentrations are forecast to fall below 1 μm^{-3} by 30m from the road
Transect 37W: A275 at Wych Cross	Extensive areas approximately 5m from the road. Area within 15m of the road unlikely to support terricolous lichens as vegetation is tall, dense and gorse encroached, providing a closed sward.	2033 ammonia concentrations are forecast to fall below 1 μm^{-3} by 5m from the road
Transect 37E: A275 at Wych Cross	Extensive areas approximately 5m from the road. Area within 15m of the road unlikely to support terricolous lichens as vegetation is tall, dense and gorse encroached, providing a closed sward.	2033 ammonia concentrations are forecast to fall below 1 μm^{-3} by 5m from the road
Transect 34: A22 at Nutley	No heathland within 200m of the road; woodland occupies this zone	2033 ammonia concentrations are forecast to fall below 1 μm^{-3} by 20m from the road
Transect 33: A22 at Wych Cross	Extensive areas approximately 5m from the road. Area within 15m of the road unlikely to support terricolous lichens as vegetation is tall, dense and gorse encroached providing a closed sward.	2033 ammonia concentrations are forecast to fall below 1 μm^{-3} by 10m from the road. Even at the roadside the contribution of the South Downs Local Plan and Lewes JCS to elevating ammonia will be effectively zero (i.e. less than 0.01 μm^{-3}).
Transect 6b_37_33: junction of A22 and A275	No heathland within 200m of the road; woodland occupies this zone.	2033 ammonia concentrations are forecast to fall below 1 μm^{-3} by 50m from the road
Transect 6b: A22 at Royal Ashdown Forest Golf Course	Large patch of heathland approximately 30m from the road, otherwise woodland occupies this zone	2033 ammonia concentrations are forecast to fall below 1 μm^{-3} by 13m from the road
Transect 6aSW: A22 at Royal Ashdown Forest Golf Course	Small patch approximately 10m from the road although heavily woodland encroached. Very unlikely to support terricolous heathland lichens due to closed canopy.	2033 ammonia concentrations are forecast to fall below 1 μm^{-3} by 15m from the road. By 10m from the road the contribution of the South Downs Local Plan and Lewes JCS to elevating ammonia will be effectively zero (i.e. less than 0.01 μm^{-3}).
Transect 6aSE: A22 at Royal Ashdown Forest Golf Course	Approximately 100m from the road although heavily scrub and tree encroached. The rest of the zone is occupied by woodland	2033 ammonia concentrations are forecast to fall below 1 μm^{-3} by 20m from the road.
Transect 6aNE: A22 at Royal Ashdown Forest Golf Course	No heathland within 200m of the road; woodland occupies this zone.	2033 ammonia concentrations are forecast to fall below 1 μm^{-3} by 15m from the road.
Transect 33N: A22 at Wych Cross	Extensive areas approximately 30m from the road; a woodland belt occupies the intervening zone.	2033 ammonia concentrations are forecast to fall below 1 μm^{-3} by 10m from the road.

4.2.7 It can be seen that even if one were to use a reference critical level of 1 μm^{-3} the nearest areas of heathland would not be affected.

Oxides of Nitrogen

4.2.8 Appendix A shows the annual mean NOx concentrations for the Baseline, Do Nothing scenario and Do Something Scenario. It also shows the 'Projected Baseline'. This is the modelled NOx concentrations in the hypothetical scenario of no traffic growth to 2033 but allowing for improvements in vehicle emissions for the existing traffic and an associated reduction in background nitrogen deposition. It is presented such that the additional NOx emissions due to traffic growth can be visually separated from the reduction in NOx concentrations due to the improving baseline. When assessing the likely effects of the planned growth in South Downs National Park by 2033, it is necessary to consider: i) the additional NOx emissions caused by growth in the region (DS - Proj BL); ii) the contribution of National Park growth to the additional emissions; and iii) the overall change in annual mean NOx concentrations by 2033, taking into account improvements in vehicle emissions standards as applied to both existing and future traffic (DS - BL).

4.2.9 Based on background mapping, adjusted for the effect of the road, the air quality calculations provided in Appendix A show that the baseline NOx concentrations are modelled to be above the 30 μgm^{-3} general Critical Level for vegetation at the roadside along all transects except for the A275.

4.2.10 The additional NOx emissions due to traffic growth 'in combination' to any heathland along the A26 (column 'DS-ProjBL' in Appendix A) would be approximately 7 μgm^{-3} by 2033, although it would drop away quickly, falling nearly 50% by 5m from the road and falling further to 1.08 μgm^{-3} at the nearest area of heathland, approximately 40m from the A26. The contribution of South Downs Local Plan/Lewes JCS to additional NOx at the closest part of the SAC to the A26[19] is forecast to be 0.96 μgm^{-3}, falling to 0.13 μgm^{-3} by the nearest area of heathland. However, improvements in NOx emission factors would also apply to the existing vehicle fleet. When a cautious allowance is made for improved emission factors applied to all traffic (existing and future), NOx is expected to remain above the critical level, but is forecast to experience a net *reduction* of c. 20 μgm^{-3} at the closest point of the SAC to the A26. The improvements in vehicle emission factors expected to 2033 are thus forecast to more than offset the increase in NOx from an increase in the volume of vehicle movements.

4.2.11 The same pattern is forecast at the roadside of the A22 and A275. At the closest point of the SAC to the A275 the additional NOx emitted due to traffic growth 'in combination' by 2033 would be approximately 2 μgm^{-3}, although it would fall off quickly, dropping c. 50% by 5m from the roadside. The contribution of South Downs Local Plan/JCS to NOx[20] would be 0.51 μgm^{-3}. When forecast improvements in emission factors across the vehicle fleet are taken into account, NOx at this location is actually forecast to experience a net reduction of c. 6 μgm^{-3} by 2033. At the closest area of heathland to the A22 (at Wych Cross) the additional NOx emitted due to traffic growth 'in combination' by 2033 would be approximately 2.3 μgm^{-3}, although it would fall off quickly, dropping c. 40% by 5m from the roadside. The contribution of South Downs Local Plan/JCS to NOx[21] would be a minimal 0.08 μgm^{-3}. When forecast improvements in emission factors across the vehicle fleet are taken into account, NOx at this location is actually forecast to experience a net reduction of c. 11 μgm^{-3} by 2033.

4.2.12 In summary, by 2033, NOx concentrations on all modelled links are forecast to experience a net reduction due to changes in vehicle emissions, notwithstanding the projected increase in traffic on the roads, including that attributable to the South Downs Local Plan/Lewes JCS[22]. The greatest net improvement is forecast to occur at the roadside on the link with the highest flows (c. 20 μgm^{-3} on the A26), while the smallest net improvement is forecast to occur at the roadside on the link with the lowest flows (c. 6 μgm^{-3} on the A275).

[19] 35% of the modelled difference between Do Something and Do Nothing in Appendix A i.e. 35% of the value in the DS-DN column

[20] 72% of the modelled difference between Do Something and Do Nothing in Appendix A

[21] 44% of the modelled difference between Do Something and Do Nothing in Appendix A

[22] Appendix C contains a technical note confirming that traffic emissions are expected to reduce year on year during the modelled plan period notwithstanding traffic growth over that same timetable; i.e. the improving trend is consistent throughout the plan period.

Nitrogen deposition

4.2.13 Since the ecologically significant role of NOx is as a source of nitrogen the next step is to consider what effect this may have on nitrogen deposition rates, and this also factors in the role of ammonia as a source of nitrogen.[23] Calculating nitrogen deposition rates rather than relying purely on scrutiny of NOx concentrations has the advantage of being habitat specific (the critical level for NOx is entirely generic; in reality different habitats have varying tolerance to nitrogen) and of being directly relatable to measurable effects on the ground through scrutiny of published dose-response relationships that do not exist for NOx.

4.2.14 As with NOx, Appendix A shows the annual mean nitrogen deposition rates for the Baseline, Do Nothing scenario and Do Something Scenario. It also shows the 'Projected Baseline'. This is the modelled nitrogen deposition rates in the hypothetical scenario of no traffic growth to 2033 but allowing for improvements in vehicle emissions for the existing traffic and an associated reduction in background nitrogen deposition. It is presented such that the additional nitrogen deposition due to traffic growth can be visually separated from the reduction in nitrogen deposition due to the improving baseline. When assessing the likely effects of the planned growth in South Downs National Park by 2033, it is necessary to consider: i) the additional nitrogen deposition caused by growth in the region (DS - Proj BL); ii) the contribution of National Park growth to the additional nitrogen; and iii) the overall change in annual mean nitrogen deposition rates by 2033, taking into account improvements in vehicle emissions standards as applied to both existing and future traffic (DS - BL).

4.2.15 Although much of Ashdown Forest SAC (including the borders of many roads) is covered with woodland and the habitat is a feature of the SSSI, woodland is not a notified feature of the internationally important wildlife sites. Ashdown Forest SAC is designated for its heathland and it is this habitat on which the birds of Ashdown Forest SPA depend. In order to undertake the nitrogen deposition modelling it is necessary to select an appropriate deposition velocity and background deposition rate. Since heathland is the SAC habitat appropriate deposition velocities for this habitat were used in the modelling since deposition to other habitats (e.g. woodland) is not relevant to the assessment.

4.2.16 Critical loads are always presented as a range, which for heathland is 10 kgN/ha/yr to 20 kgN/ha/yr[24]. The lowest part of the nitrogen Critical Load range has been used in this assessment as that is the most precautionary stance to take. The baseline for nitrogen deposition to heathland along A26 and A275 is above the Critical Load and has been modelled to be c.16-20 kgN/ha/yr at the closest points to the road, declining to 13-14 kgN/ha/yr by 200m from the road. Measured data suggests that against some road links actual deposition rates are considerably higher. The results relating to the nearest areas of heathland are summarised in Table 4 below.

Table 4. Total additional nitrogen deposition due to growth 'in combination' at closest area of heathland

Link/Transect	Nearest existing area of heathland	Summary of results 'in combination'
Transect 38: A26 at Poundgate	Approximately 40m from the road, although most is more distant.	0.16 kgN/ha/yr at 40m from the road (0.98 kgN/ha/yr at the roadside)
Transect 37W: A275 at Wych Cross	Extensive areas approximately 5m from the road.	0.16 kgN/ha/yr at 5m from the road (0.34 kgN/ha/yr at the roadside)
Transect 37E: A275 at Wych Cross	Extensive areas approximately 5m from the road.	0.15 kgN/ha/yr at 5m from the road (0.26 kgN/ha/yr at the roadside)
Transect 34: A22 at Nutley	No heathland within 200m of the road	-
Transect 33: A22 at Wych Cross	Extensive areas approximately 5m from the road.	0.20 kgN/ha/yr at 5m from the road (0.34 kgN/ha/yr at the roadside)
Transect 6b_37_33: junction of A22 and A275	No heathland within 200m of the road	-

[23] Acid deposition rates for all transects on all modelled links are expected to improve over the plan period and the contribution of the South Downs Local Plan/Lewes JCS to any retardation of that improvement is effectively zero, in that any contribution is too small to show in the model (i.e. it would affect the third decimal place or beyond, which are never reported in modelling). Acid deposition is therefore not discussed further in this document.

[24] APIS advises to use the high end of the range with high precipitation and the low end of the range with low precipitation and to use the low end of the range for systems with a low water table, and the high end of the range for systems with a high water table.

Transect 6b: A22 at Royal Ashdown Forest Golf Course	Large patch approximately 30m from the road	0.07 kgN/ha/yr at 33m from the road (0.28 kgN/ha/yr at the roadside)
Transect 6aSW: A22 at Royal Ashdown Forest Golf Course	Small patch approximately 10m from the road although heavily scrub and tree encroached.	0.18 kgN/ha/yr at 10m from the road (0.47 kgN/ha/yr at the roadside)
Transect 6aSE: A22 at Royal Ashdown Forest Golf Course	Approximately 100m from the road although heavily scrub and tree encroached.	0.05 kgN/ha/yr at 100m from the road (0.58 kgN/ha/yr at the roadside)
Transect 6aNE: A22 at Royal Ashdown Forest Golf Course	No heathland within 200m of the road	-
Transect 33N: A22 at Wych Cross	Extensive areas approximately 30m from the road.	0.06 kgN/ha/yr at 30m from the road (0.31 kgN/ha/yr at the roadside)

4.2.17 At the closest areas of heathland to modelled links (which are along the A275 and part of the A22) the worst-case additional deposition due to extra traffic is forecast to be c. 0.3 kgN/ha/yr at the roadside, declining rapidly, such that they reduce by c. 50% by 5m from the roadside. The contribution of South Downs Local Plan/Lewes JCS to nitrogen deposition at the roadside of the A275 would be a negligible 0.07 kgN/ha/yr[25], falling to effectively zero by 20m from the road. The contribution of South Downs Local Plan/Lewes JCS to nitrogen deposition at the roadside of the A22 would be a negligible 0.02 kgN/ha/yr[26], falling to effectively zero by 20m from the road.

4.2.18 Most importantly, the DS-BL column in Appendix A shows that the deposition from additional traffic (irrespective of source) is forecast to be offset by a much larger reduction in background deposition expected over the same timescale. As a result a net *reduction* in deposition of 1.6-1.9 kgN/ha/yr (depending on link) is actually forecast at the roadside notwithstanding traffic growth[27].

Ecological significance

4.2.19 The modelling demonstrates that there will be a net decreasing trend in nitrogen deposition rates to heathland within the SAC along the modelled links. Accordingly, the Local Plans will not have significant in-combination effects on the SAC by way of contributing to any net increase in nitrogen deposition.

4.2.20 It is however worth considering whether the Local Plans could have a significant effect on the SAC as a result of retarding the improvement of nitrogen deposition rates, as paragraph 4.2.17 and the modelling in Appendix A identify that the forecast improvement in deposition rates to heathland would be slightly lower due to expected traffic growth than in the hypothetical situation of no further traffic growth (compare column DS, which is the forecast 2033 deposition rates including traffic growth, with column 'Proj BL', which is the forecast 2033 deposition rates if there were no traffic growth). Drawing a conclusion on this matter requires ecological interpretation to determine whether an abstract retardation of improvement in nitrogen deposition is likely to result in a real terms ecological impact.

4.2.21 Deposition of nitrogen can cause a variety of responses in heathland: transition from heather to grass dominance, decline in lichens (such as *Cladionia* species), changes in plant biochemistry and increased sensitivity to stress[28]. The physical, measurable and observable manifestations of these responses are generally in terms of reduction in species richness[29], reduction in cover (or increase in grass cover) and resulting changes in broad habitat structure. These responses are not independent: for example, reduction in species richness can cause, and in turn be

[25] 72% of the modelled difference between Do Something and Do Nothing for this link in Appendix A
[26] 44% of the modelled difference between Do Something and Do Nothing for this link in Appendix A
[27] If the actual current roadside deposition rates are substantially higher than that included in the AECOM model, the percentage reduction in nitrogen deposition rate by 2033 would be the same but the actual reduction in deposition rate would be much greater.
[28] Caporn, S., Field, C., Payne, R., Dise, N., Britton, A., Emmett, B., Jones, L., Phoenix, G., S Power, S., Sheppard, L. & Stevens, C. 2016. Assessing the effects of small increments of atmospheric nitrogen deposition (above the critical load) on semi-natural habitats of conservation importance. Natural England Commissioned Reports, Number 210. Table 1 page 2
[29] This is a good indicator of the effect of nitrogen deposition on vegetation as it arises at low background deposition rates, is easily detectable and occurs across different habitats. The exception appears to be calcareous grassland where there is no correlation between nitrogen deposition and species richness; for that habitat, rather than there being a reduction in the average number of species per quadrat the reduced frequency of less competitive species appears to be offset by the increased frequency of more competitive species.

exacerbated by, changes in habitat structure. Note that 'reduction in species richness' only means that fewer species are recorded in a randomly placed 2m x 2m quadrat. Therefore, it does not mean species are 'lost' from the affected area; it simply means that at least one species occurs at a reduced frequency[30]; it is therefore a relatively subtle metric.

4.2.22 Critical Loads have been in use for a number of years and have been defined as: '*a quantitative estimate of exposure to one or more pollutants below which significant harmful effects on specified sensitive elements of the environment do not occur according to present knowledge*'. However, more recent studies[31] comparing deposition rate with reduction in species richness and other parameters indicate that the response of habitats such as heathland to long-term nitrogen deposition is curved for most parameters, with some of the sharpest losses in diversity occurring below the critical load[32]. Moreover, those studies also indicate that the effect on species richness of adding a given amount of nitrogen in many habitats is not simple, linear and additive as is often assumed (i.e. 'x' amount of further nitrogen equates to 'x' amount of vegetation effect irrespective of current nitrogen dose) but is heavily influenced by the existing nitrogen deposition rate. It has thus become clear that the response of vegetation to nitrogen deposition is more nuanced that the 'black and white' critical load concept suggests.

4.2.23 The amount of extra nitrogen needed to cause a measurable ecological effect has been shown from a range of studies on a range of sites to be considerably greater in lowland heathland subject to high existing deposition rates than it is in those with low existing deposition rates. This is true for most parameters, whether that effect is defined in terms of reduction in species richness, reduction in species cover, or probability of species presence[33]. The only metric for which this relationship appears not to be true is with regard to increases in grass cover[34]. Putting it simply, a small amount of additional nitrogen is much less likely to significantly affect a heathland already subject to high inputs than it is to affect one subject to low inputs. Ultimately, it is the predicted effect on the site vegetation (and thus its ability to achieve its conservation objectives) that is the key factor in determining whether there will actually be a significant effect i.e. an effect on the integrity of a site, rather than NOx concentrations or nitrogen deposition rates in the abstract. Therefore, it is possible for an increase in nitrogen deposition to fail to result in a measurable (and thus significant) ecological effect on the ground, even when the critical load is far exceeded, depending on the size of the 'dose'.

4.2.24 Given this background, it is necessary to refer to dose-response relationships and the forecast background deposition rate by 2033 to determine the ecological effect of a given retardation in nitrogen deposition rate. Since there is a significant improvement in nitrogen deposition rates in the Do Something scenario, the relevant question is whether there would be an ecological difference between any improvement in the vegetation due to the Projected Baseline and that resulting from the Do Something scenario. In real terms, would one expect a meaningful ecological difference in vegetation characteristics between an improvement in the rate of nitrogen deposition of 1.71 kgN/ha/yr and one of 1.55 kgN/ha/yr (the nearest area of heathland at receptor 38, the A26 at Poundgate) or between an improvement of 1.96 kg N/ha/yr and one of 1.68 kgN/ha/yr (adjacent to receptor 37W, A275 at Wych Cross), or between an improvement of 1.93 kgN/ha/yr and one of 1.67 kgN/ha/yr (receptor 37E, A275 at Wych Cross) or between an improvement of 1.70 kgN/ha/yr and one of 1.65 kgN/ha/yr (receptor 33N, A22 at Wych Cross).

4.2.25 Reference to Appendix 5 of Caporn et al (2016) suggests that at background deposition rates of c. 15kgN/ha/yr (the approximate deposition rate forecast at the closest areas of heathland in this modelling) the forecast net reduction in nitrogen deposition at the most affected areas of heathland (a little less than 2kgN/ha/yr) could potentially result in an increase in species richness (whether grass species richness, moss species richness or total species richness) of up to c. 3-4% of the maximum. Using a total maximum species richness of 37 species[35] this would mean approximately 1-2 more species could be found in the sward on average. Such a reduction in deposition rates could also result in a reduction in grass (graminoid) cover of up to 1%[36] **if** other

[30] Caporn et al (2016), page 39
[31] Compiled and analysed in Caporn et al 2016
[32] Ibid. paragraph 5 page ii
[33] Ibid. Tables 20-22, pages 57-60 show that, for lowland heathland, as background deposition rates increase the effect of adding a given amount of extra nitrogen decreases for most parameters
[34] Grasses often benefit at the expense of other species in habitats subject to elevated nitrogen deposition and as such their abundance increases rather than decreases; however, grass cover is also heavily influenced by other factors unrelated to nitrogen deposition
[35] 37 species is the maximum species richness in the lowland heathland sample reported in NECR2010 and is the reference species richness for lowland heathland used throughout that report.
[36] Appendix 5, Caporn et al (2016)

factors that are likely to have a much greater effect on species richness and grass cover than nitrogen deposition (such as management and drainage) are suitable.

4.2.26 Appendix 5 of Caporn et al (2016) also suggests that at a background deposition rate of 15 kgN/ha/yr the worst-case additional nitrogen deposition to heathland as a result of traffic growth (c. 0.3 kgN/ha/yr at the A275 and parts of the A22) could, if it constituted a net increase in deposition, result in a 0.1% increase in grass (graminoid) cover and a 0.6% reduction in species richness (whether grasses, mosses or total species richness) at the roadside (the change away from the roadside would be much less). However, expressing the change in species richness as a percentage takes no account of the fact that one cannot have a fraction of a species (for example, 0.6% of 37 species would be a reduction of 0.2 species, which is not possible). This interpretive problem is addressed by expressing the same data in relation to the nitrogen dose that would reduce species richness by at least 1 species. In practice this therefore defines the minimum nitrogen dose that would be expected to result in a change in the number of species recorded. Table 21 of Caporn et al (2016) shows that, based on the heathlands surveyed, at a background nitrogen deposition rate of c. 15 kgN/ha/yr species richness in lowland heathland would not be expected to change until a dose of c. 1.3 kgN/ha/yr.

4.2.27 In terms of changes in coarse habitat structure it is considered that the small forecast additional nitrogen deposition (equivalent to c. 2% of the deposition rate otherwise forecast in these locations by 2033) would not stimulate growth to such an extent that a material change in management burden occurred, and the structure of the sward is dictated primarily by management.

4.2.28 Bearing in mind that a net reduction in nitrogen deposition is actually being forecast, the most that might be expected by 2033 due to traffic growth on roads through the SAC is that one *might* record a reduction in percentage grass cover immediately adjacent to the A22 and A275 of 0.9%, as opposed to a potential 1% reduction in the hypothetical case of no traffic growth. Whether any difference would actually be observed in practice would depend heavily on other factors, because management regime in particular has a much greater influence than nitrogen deposition on parameters such as percentage grass cover and species richness. The total species richness (or number of moss species or grass species) would not be expected to be any different in practice than would be the case without any traffic growth.

4.2.29 This conclusion can be stated with a high degree of confidence for a number of reasons. First, AECOM has carried out sensitivity testing of nitrogen deposition rates using different deposition velocities. The AECOM model uses a nitrogen deposition velocity for heathland ('short vegetation') of 0.1 $cms^{-1.}$ That accords with the DMRB guidance and is also very close to that used in Environment Agency guidance (which uses a figure of 0.15 cms^{-1}). However, the trends described above would still arise with much higher deposition velocities[37].

4.2.30 Secondly, the results hold true even if actual measured deposition rates are substantially higher than those extrapolated from Defra mapping, as is suggested by measured data provided by Wealden District Council[38]. For example, at background deposition rates of 30 kgN/ha/yr, an additional 2.4 kgN/ha/yr would be required to reduce the average species richness of the sward.[39]

4.2.31 Thirdly, the conclusions are supported by solid academic research. Southon et al (2013) studied over fifty heathlands across England at deposition rates of up to 32.4kgN/ha/yr and found that above 20 kgN/ha/yr *'… declines in species richness plateaued, indicating a reduction in sensitivity as N loading increased'.* The heathland sites covered by the research reported in Caporn et al (2016) had a wide geographic spread and were subject to a range of different 'conditions' but the identified trends were nonetheless observable. The fact that a given heathland site may not have been included in the sample cannot be a basis for the identified trend to be dismissed as inapplicable. On the contrary, the value of the available dose-response research is precisely in the fact that it covers a geographic range of sites subject to a mixture of different influences that might otherwise mask the nitrogen relationships if a given site was looked at in isolation. Caporn et al (2016) illustrates that consistent trends have been identified *despite* the differing geographic locations of those habitats and different conditions at the sites involved.

[37] AECOM has undertaken sensitivity testing using deposition velocities of 0.24 cms^{-1} and 0.34 cms^{-1} to heathland (Environment Agency and DMRB guidance reserves such high deposition velocities for woodland). This still results in a large forecast net improvement in nitrogen deposition.

[38] AQC report- Ashdown Forest SAC, Air Quality Monitoring and Modelling, December 2017 update with some redacted locations reinstated

[39] Table 21 of Caporn et al 2016

4.2.32 Heathland and acid grassland (a related habitat that is often found intermixed with heathland) have been particularly well studied across broad geographical, climatic and pollution gradients covering different levels of soil organic matter, rates of nutrient cycling, plant species assemblages and management regimes. Despite this, the overall trends, including that a given 'dose' of nitrogen generally has less effect on a range of vegetation parameters (other than gras cover) as background deposition rates rise has been reported by various peer reviewed academic papers[40]. Southon et al (2013) surveyed 52 heathlands across England and observed statistically significant trends despite the large differences in conditions of these heathlands. That paper specifically states that '*the biggest reductions in species number* [were] *associated with increasing N inputs at the low end of the deposition range'* and that '*The similarity of relationships between upland and lowland environments, across broad spatial and climatic gradients, highlights the ubiquity of relationships with N*'. Based on the consistent trend across the range of habitats studied (including wet habitats such as bogs as well as lowland heathland, upland heathland and dune systems) there is no basis to assume that the identified trends would not be applicable to all types of heath, including wet heath. Upland heathlands tend to be wetter than lowland heathlands due to climate differences and yet the same pattern has been observed as reported in Southon et al (2013).

4.2.33 Due to the existence of other influences (such as management) that have a much greater effect on relevant vegetation parameters than does nitrogen deposition, there can be no absolute certainty that the reported trends would be observed in a given part of Ashdown Forest. However, there is a reasonable scientific expectation that the observed relationships would be detected if Ashdown Forest was included in the broader sample.

4.2.34 Fourthly, although it is necessary to carry out an 'in-combination' assessment of effects, it remains relevant to consider the extent to which South Downs Local Plan and Lewes JCS contribute to that in-combination effect. On that assessment, their contribution to nitrogen deposition is negligible at the closest areas of heathland to all modelled links.

4.2.35 Finally, in discussions over the emerging Statement of Common Ground, Natural England advised that the impact assessment should only include those areas which are currently heathland rather than speculate about parts of the SAC that constitute other habitats (particularly woodland) and may or may not be put down to heathland at an unspecified point in the future. As set out above, in relation to the A26 at Poundgate, there is no significant presence of heathland within 40m of the roadside so the relevant comparison is an improvement in the rate of nitrogen deposition in the Projected Baseline of 1.71 kgN/ha/yr and an improvement in the Do Something Scenario of 1.55 kgN/ha/yr (rather than 2.73 kgN/ha/yr and 1.75 kgN/ha/yr). A retardation of improvement of 0.16 kgN/ha/yr is clearly not of any ecological significance. Nonetheless, as a final precautionary step and for completeness, those areas were included in the modelling presented in Appendix A on the hypothetical (and unrealistic) assumption that heathland might be created at the roadside at some stage in the future. This enables consideration of whether, in the event that proposals emerged during the period to 2033 to establish heathland at the most affected part of the modelled network, the deposition rates forecast would hinder that process. The most affected part of the network according to this modelling is the location where forecast additional nitrogen deposition due to traffic growth is greatest, irrespective of the habitat actually present, and is an area of woodland immediately adjacent to the A26.

4.2.36 In the event that plans emerged to establish heathland in the area immediately adjacent to the A26 this location would still experience a net reduction in nitrogen deposition rate of c. 1.75 kgN/ha/yr by 2033 compared to the baseline situation. Due to traffic growth over the period to 2033, this reduction in deposition rate would be c. 0.98 kgN/ha/yr less than might otherwise be the case. Reference to Appendix 5 of Caporn et al (2016) suggests that the contribution of all growth at the closest point to the A26 *may* be sufficient to reduce heathland species richness by 2% compared to what would otherwise occur at that location in the absence of traffic growth, but according to Table 21 of Caporn et al (2016) this is still less than the amount required to result in an actual reduction in the number of species recorded in a quadrat at the forecast background

rate of 17 kgN/ha/yr[41]. The contribution of South Downs Local Plan/Lewes JCS to additional nitrogen at the closest part of the SAC to the A26 is forecast to be 0.12 kgN/ha/yr.[42] However, the forecast deposition rate of c. 16-17 kgN/ha/yr (with or without future traffic growth) would not prevent heathland being established if there was ever a desire to do so. The ability to create heathland adjacent to the A26 is likely to be influenced much more by other factors such as management, soil pH, soil phosphate levels, drainage and the removal of tree trunks and root systems[43].

[41] Using the relationships identified in Caporn et al (2016) species richness would need to be 50 species for a reduction in species-richness of 2% to equate to a reduction of 1 species.

[42] 35% of the modelled difference between Do Something and Do Nothing for this link in Appendix A

[43] The process of creating, and then resurfacing/maintaining a significant road and buried roadside services (where these are present) or drainage, often results in changes to the underlying geology and hydrological function of the soils at the roadside, including from the importation of atypical fill material during historic road construction. These habitats can be further affected by surface water runoff all year round (depending on local topography) and salt spray from winter gritting. In addition, it is often desirable to retain a belt of permanent forestry adjacent to roads in order to serve as a buffer feature to the heathland and (for the SPA) the disturbance-sensitive bird populations that lie behind it. The area adjacent to the road is the area most affected by nitrogen deposition due to local traffic.

5 Conclusion

5.1.1 The development of nitrogen dose-response relationships for various habitats clarifies the rate of additional nitrogen deposition required to achieve a measurable effect on heathland vegetation. It is therefore possible to use these relationships to determine that a plan or collection of plans will not have an adverse effect. Such a plan would be one in which one could say with confidence that a) there would not be a significant difference in the vegetation whether or not that plan proceeded and b) there would not be a significant effect on the vegetation (and thus protection conveyed to the European site) whether or not the contribution of that plan was 'mitigated' (i.e. reduced to such an extent that it did not appear in the model at all). It would clearly be unreasonable to claim that such a plan caused an adverse effect 'in combination' or that it should be mitigated. The contribution of the South Downs Local Plan and Lewes JCS falls within those parameters.

5.1.2 Since a) air quality in 2033 is forecast to be significantly better than in 2017 notwithstanding the precautionary assumptions made about both growth and improvements in vehicle emissions factors, b) no significant in combination retardation of vegetation improvement at the closest and most affected areas of heathland is expected and c) the contribution of South Downs Local Plan/Lewes JCS to the 'in combination' scenario is negligible, the modelling in Appendix A does not provide any basis to conclude an adverse effect on integrity of Ashdown Forest SAC or SPA from growth in South Downs National Park or Lewes District over that period in combination with other plans. Since no net adverse effect on integrity is forecast, no mitigation as such would be required.

5.1.3 It should be noted that the assessment undertaken to inform this conclusion was precautionary. For example:

- The Design Manual for Roads and Bridges and Defra guidance recommend making a 2% reduction per annum in background emissions/deposition rates throughout the period from base year to assessment year in order to allow for improvements such as the introduction of Euro6 standard vehicles. AECOM took a considerably more cautious approach in this modelling which could therefore prove to underestimate improvements in background nitrogen deposition.
- Rather than simply model the rates of growth set out in adopted or submitted Core Strategies and Local Plans, the AECOM model increased the housing delivery rates for those authorities immediately surrounding Ashdown Forest SAC (Wealden District, Mid-Sussex District and Tandridge District) to allow for additional growth in line with the most-recently expressed Objectively Assessed Need as of June 2017. In some cases (e.g. Mid-Sussex) this substantially increased the amount of housing allowed for over the period to 2033. In practice, therefore, growth around Ashdown Forest SAC may have been over-estimated. For example, the recent Government consultation on Objectively Assessed Need (OAN) proposes a significantly lower OAN for Wealden District than was allowed for in the AECOM model.

5.1.4 It is therefore be concluded that no adverse effect upon the integrity of Ashdown Forest SAC is expected to result from development provided by the South Downs Local Plan/Lewes JCS, even in combination with other plans and projects. This is due to a combination of a) an expected net improvement in air quality over the Local Plan period, b) the fact that, whether or not that improvement occurs to the extent forecast, the contribution of the South Downs Local Plan/Lewes JCS to changes in roadside air quality is demonstrably ecologically negligible due to the very small magnitude and c) the precautionary nature of the modelling. Moreover, the Local Plan and Joint Core Strategy both contain sustainability policies (notably Local Plan policy SD19 (Transport and Accessibility) and Joint Core Strategy policy 13 (Sustainable Travel)) which are not factored into these traffic/air quality calculations and aspects of which have some potential to reduce the need for journeys to work by private vehicle towards Ashdown Forest; thus further reducing the already small contribution to increased vehicle movements on the A26 that is forecast to arise from the Local Plan and JCS. For information, these policies are presented in Appendix F.

5.1.5 This conclusion is not intended to suggest that no active attempt should be made to reduce background NOx concentrations and nitrogen deposition around Ashdown Forest as a matter of general good stewardship if that is what the authorities agree, and the authorities already have a forum for collaborative involvement in this issue via the working group that has recently been convened by South Downs National Park Authority. The aforementioned forum will also be important in monitoring long-term trends in roadside air quality within Ashdown Forest SAC at regular (e.g. five-year) intervals, in order to track the forecast improvements and, if necessary, trigger updates to the modelling and its conclusions during the plan period. The first practical outcome of this forum is a multi-authority agreement to prepare a Statement of Common Ground (SoCG) relating to nitrogen impacts on Ashdown Forest. The SoCG will include actions such as a Site Nitrogen Action Plan (SNAP) for the SAC/SPA to address sources of background nitrogen such as agriculture and existing traffic. This forum will provide a further safeguard to ensure that changes in traffic flows and vehicular emissions stemming from development do not result in adverse effects upon the integrity of Ashdown Forest SAC in isolation or in combination.

Appendix B. Extract from Caporn et al (2010)

Table 21 of Caporn et al (2010): Summary of relationships between long-term nitrogen deposition and species richness by habitat expressed as the amount of incremental N deposition (in kg N ha^{-1} yr^{-1}) associated with a reduction in species richness of one species along the survey gradient sites. Modelled relationship only applied over N deposition range in which survey sites occurred; where no sites were surveyed at a given N deposition level '-' is shown.

Survey/ Habitat/	Max. species richness	Habitat/ species critical load kg N ha^{-1} yr^{-1}	Increase in N deposition (in kg N ha^{-1} yr^{-1}) required to reduce measured species richness by 1 at different background long-term N deposition levels					
			5 kg N	10 kg N	15 kg N	20 kg N	25 kg N	30 kg N
Upland heath (TU 2009)								
Total species richness	42 spp.	10-20	0.4 kg	0.8 kg	1.3 kg	1.7 kg	2.0 kg	2.4 kg
Upland heath (MRS)*								
Total species richness	16 spp.	10-20	1.7 kg	2.0 kg	2.5 kg	3.3 kg	5.0 kg	20.0 kg
Lowland heath (TU 2009)								
Total species richness	37 spp.	10-20	0.4 kg	0.8 kg	1.3 kg	1.7 kg	2.0 kg	2.4 kg
Bog (TU 2009)								
Total species richness	32 spp.	5-10	3.3 kg					
Sand dunes (TU 2009, all sites)								
Total species richness	77 spp.	8-15	0.1 kg	0.5 kg	1.1 kg	2.0 kg	-	-

*in the upland heath MRS survey quadrat size was 0.5 x 0.5 m. This produced different results than the other surveys which used 2 x 2 m quadrats.

Appendix C. Annual Drop-off Calculations for Intermediate Years between 2017 and 2033

AECOM was asked to undertake calculations for intervening years between 2017 and 2033 (rather than simply the start year of 2017 and end year of 2033) in order to show whether NOx emissions in any given year would increase for any period before a decrease was observed.

Traffic flow data for the interim years were derived from the 2033 traffic modelling for Tunbridge Wells Local Plan in late 2017. EFT v8.0.1 has been used to calculate annual drop off calculations to determine if there is a risk of an intermediate year having higher emissions than the scenarios currently tested by AECOM, although the latest modelling work for Ashdown Forest has used EFT v8.0.0. The differences in the EFT from V8.0.0 to v8.0.1 are reproduced below and should not affect this analysis. To confirm this interpretation the base 2017 and DM/DS 2033 traffic data used in the previous assessment has been reprocessed to confirm the suitability for comparison of the different EFT versions. Changes from EFT v8.0.0 to EFT v8.0.1:

- Bug fix to correct the bus and coach split on London roads when entering data using the Alternative Technologies traffic format input option only.
- Bug fixes to allow compatibility with Excel 2007 and 64-bit instances of Excel.

The drop off calculations have been calculated on the same basis as the 2033 assessment method utilised for the previous assessments, with only partial improvements assumed compared to DEFRA predictions. The emission year associated with each year of traffic data is as follows:

- Base 2017 traffic with 2017 emissions;
- 2020 traffic with 2018 emissions;
- 2023 traffic with 2019 emissions;
- 2025 traffic with 2020 emissions;
- 2028 traffic with 2021 emissions;
- 2031 traffic with 2022 emissions; and
- 2033 traffic with 2023 emissions (as presented in the assessments).

The following graphs, presented separately for the ‘with’ (DS) and ‘without’ (DM) plan scenarios, show the emissions per link for each of the above scenarios.

Figure 1. NOx Emission Rate (g/km/s) Per Year Per Link in DM Scenario

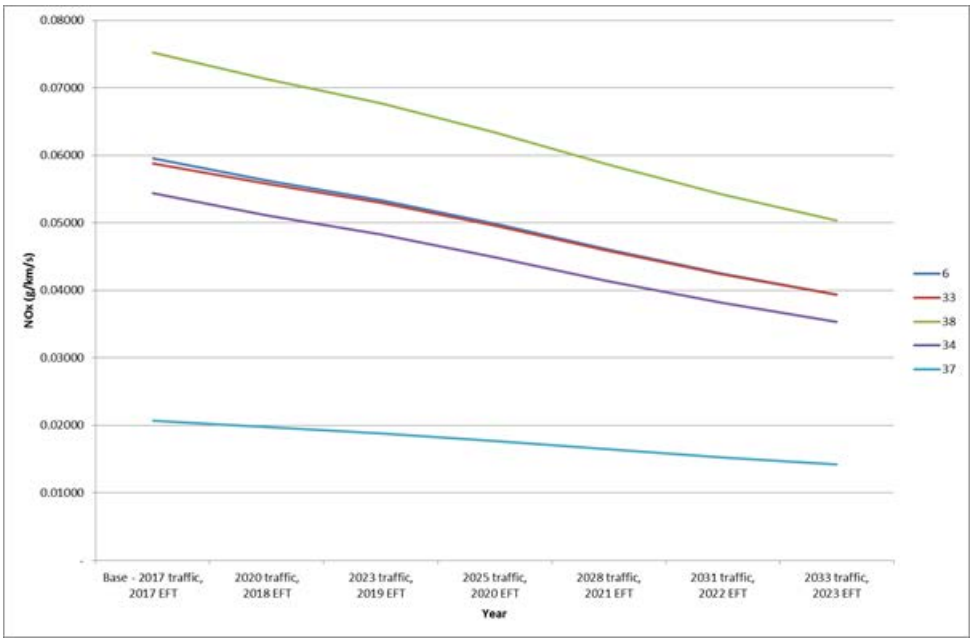

Figure 1 demonstrates that, for the DM scenario (i.e. all growth except Tunbridge Wells Local Plan, Lewes JCS and South Downs Local Plan), emission rates are projected to fall year on year for each link included in the AECOM modelling approach despite the growth in traffic projected in the DM scenario. Each coloured line below represents a separate link.

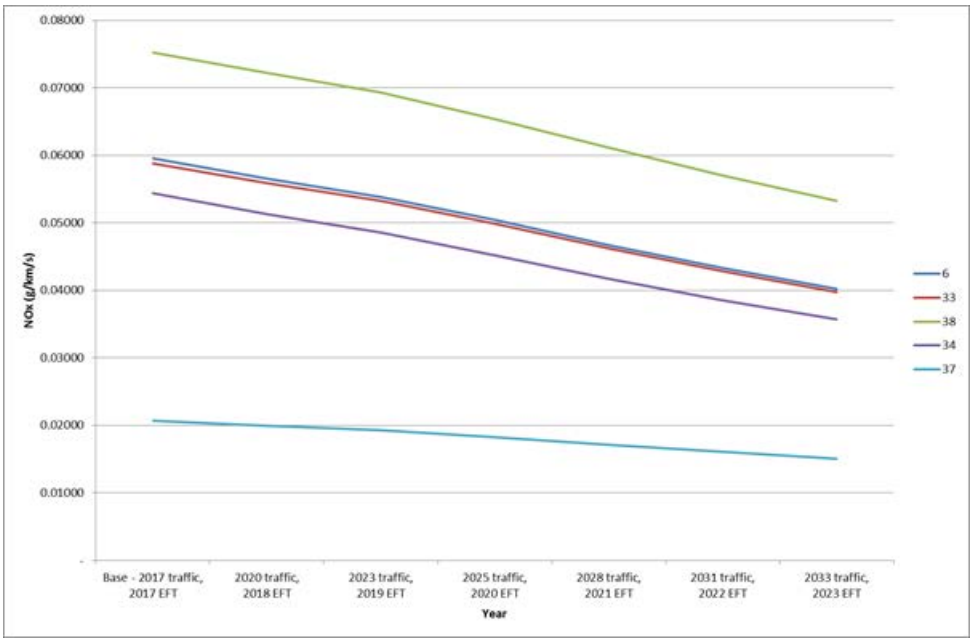
This effect is also present, although slightly less pronounced, in Figure 2, which represents the DS scenarios. The year on year fall in emissions trend remains the same. The effect is slightly less pronounced than in the DM graph due to the additional traffic from the Local Plans that are incorporated into the DS traffic flows.

Figure 2. NOx Emission Rate (g/km/s) Per Year Per Link in DS Scenario



This analysis has not been carried through into a dispersion model assessment as it is considered this presentation of emission rates clearly falling is sufficient to illustrate that despite the increase in vehicle numbers in the future the increases under the AECOM analysis approach are not of sufficient magnitude to result in an increase in emissions.

Summary

The interim year emissions calculations demonstrate that there are no points where the increase in traffic due to growth or the local plan offsets the improvements in emission rates over time (using conservative assumptions on improvements in emission rates). Therefore no change to standard assessment practice of considering the full plan period is proposed.

It is also essential to note that for vegetation long-term trends in air quality are more important than short-term fluctuations. The ecological effects of nitrogen deposition are most associated with persistent long-term exposure (i.e. many years). Whether growth will result (for example) in an increase in nitrogen deposition for a couple of years before improvements in emission factors and background rates 'catch up' would be less important than whether there will be a persistent net increase or decrease in deposition over the plan period.

Appendix D. Modelling ammonia emissions from traffic

Data Sources

The ammonia modelling has used 2015 road transport emission factors from the National Atmospheric Emissions Inventory website (NAEI, latest available data). This document produces average ammonia emission factors for various types of transport and environments in grams per kilometre (g/km). The NAEI road transport emission factors include average speed throughout the UK and the speeds used to derive these g/km emission rates may be different to the speeds used in the air quality model but this is a known limitation of the ammonia modelling.

Concentration data for the ammonia modelling from AQC transects has been made available in the partially redacted report however the coordinates of the monitoring locations have not been provided. All of the images and data relating the transects and location of the NH_3 sensors has been redacted save for the NO_2 monitored data maps (Figures A1.35 and A1.36 on pages 242/243 of AQC report). This NO_2 monitoring map has been used this to identify the location of the transects as both NO_2 and NH_3 were monitored on the transects. The transects have been identified from the following information:

- Transect 4 ends in monitoring location T18 and is near one of the AECOM modelled roads although NH_3 was not measured on this transect;
- Transect 1 is the only transect extending west as stated on page 14 of the AQC report;
- Transect 2 is opposite transect one as on page 88 it states "*The pattern of fall-off is much steeper for Transect 1 than for Transect 2 , which may reflect the influence of prevailing wind direction on roadside concentrations*"; and
- Transect 3 has "*relatively lower traffic volumes than the roads beside the other transects*" so must be located in isolation away from the other transects.

The AECOM model does not have a modelled link next to transect 3 therefore only transects 1 and 2 have been used to verify NH_3 predictions.

The coordinates for the NH_3 monitoring locations on transect 1 and 2 have been approximated as the specific coordinates for the monitored locations have been redacted. The approximate locations have been confirmed in Google Earth as the measurements sites are visible. These have been informed by the angle from the road in the NO_2 monitoring figure, distance from the road in the AQC report and given a height of 2m as the AQC report states that all ALPHA NH_3 models were at 2m.

A background concentration of 0.6 ug/m^3 has been used from the NH_3 DELTA samplers in the AQC report which states that these were background locations.

The NH_3 measurement data in transects 1 and 2 as used in the verification are presented in Table 2.

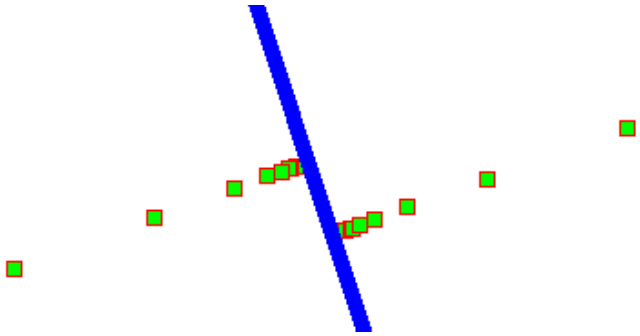
Table 2. Ammonia Monitoring

Transect	Distance from Road (m)	Measured Concentration (µg/m^3)
Transect 1	1.7	1.7
	2.5	1.3

	5.0	0.9
	10	0.9
	22	0.7
	100	0.6
Transect 2	1.7	1.4
	2.5	1.3
	5.0	1.0
	10	0.9
	22	0.7
	100	0.8

Source: AQC report- Ashdown Forest SAC, Air Quality Monitoring and Modelling, October 2017

Transects 1 and 2 are represented in the ADMS-Roads model as follows, with Transect 1 to the west, upwind of the road, and Transect 2 to the east, down wind of the road.



If the road was a notable source of ammonia it would be anticipated that Transect 2, as the downwind transect, would have higher concentrations than Transect 1. Whereas the measurement data shows the opposite trend at the closest points, with slightly higher ammonia concentrations upwind and identical concentrations at 5m.

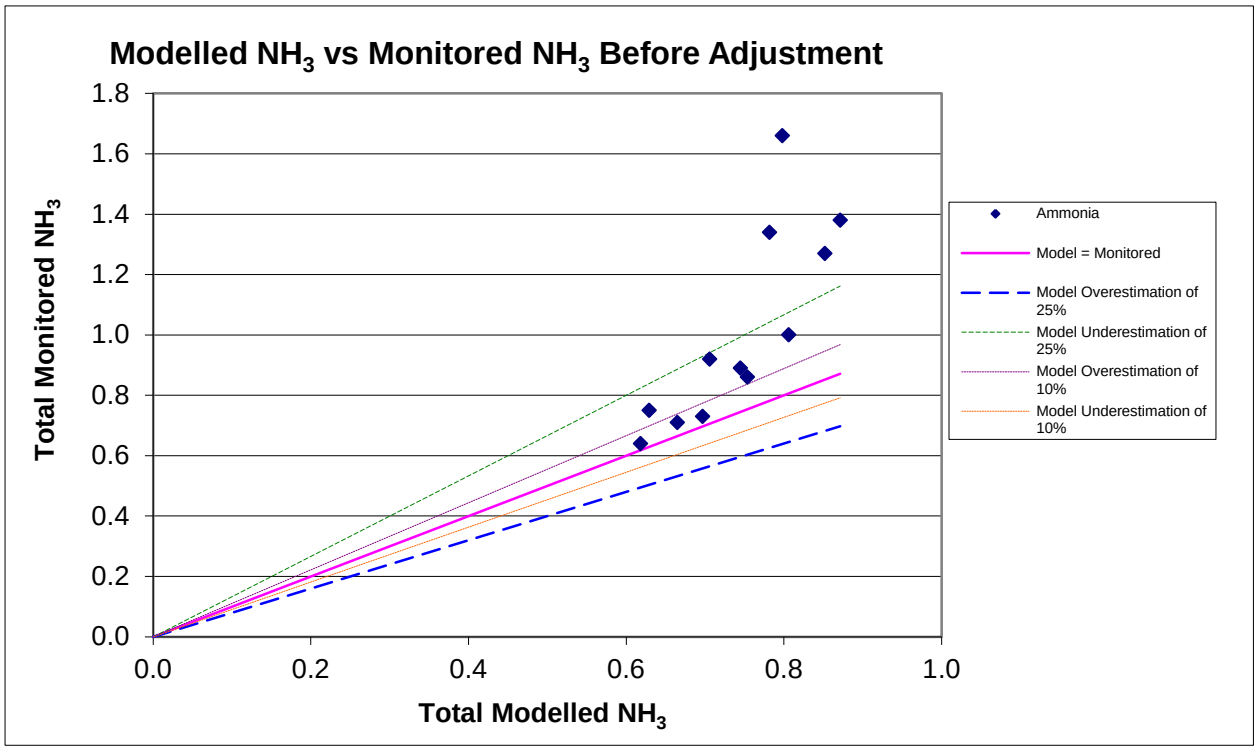
It can also be seen that concentrations of ammonia are very similar to measured background ammonia concentrations of 0.6 µg/m^3 beyond 20m from the road. Any ammonia emissions due to the road are therefore considered to be observable in the measured data, but the patterns are less clear than would be expected from key road traffic pollutants (i.e. NOx), even at the measurement points within 5m of the road and they are largely imperceptible beyond 20m.

The monitoring also shows an increase in ammonia concentrations at 100m on Transect 2, compared to closer points. This indicates that there is likely to be another source of ammonia in the vicinity of the monitoring and shows that other sources of ammonia may be more important locally than the road network.

Verification

Ammonia emissions were input based on a representative vehicle split for rural England in 2015 using data on vehicle fleet from the Emission Factor Toolkit published by Defra, and maintaining the light duty vehicle/heavy duty vehicle (LDV/HDV) split in the traffic data provided, using hot exhaust emission factors only from the NAEI 2015 road transport emission factors.

Plotting monitored vs modelled total NH_3 concentrations before any correction showed two clear patterns of behaviour with four points notably out of agreement with the rest of the dataset. These four points are the two closest points of each transect (at 1.7 and 2.5m) where concentrations are notably higher along with higher adjustment factors.



Using these input data an adjustment factor of **2.94** was calculated, with an RMSE of 0.2.

The adjustment of the ammonia model highlights that the ammonia model is less accurate close to the road source (e.g. at 1.7-2.5m from the road source). This supports the above observations of the measured ammonia concentrations that concentrations are most notably higher than background concentrations very close to the roads, as there is a larger under prediction at these verification locations closer to the road source. This under prediction doesn't appear to be due to canyoning effects as it is fairly open at this location. The resultant verification factor, if applied elsewhere, is therefore conservative as these closest points are included within the overall factor derived above.

Therefore, any ammonia predictions beyond this distance are likely to overestimate ammonia contributions, and beyond 20m, unless the road source is a much larger road than here, ammonia road contributions may not in reality be discernible at the ecosystem compared to normal ammonia background concentrations.

Assessment

Modelling has also been carried out to predict concentrations of ammonia and the influence of ammonia on nitrogen deposition rates using the methodology outlined above with the following assumptions for the assessment year:

- 2033 with and without the local plan traffic flows;
- 2023 traffic fleet mix (in keeping with NOx predictions);
- 2015 ammonia emission rates (as projected rates are not available from the NAEI); and
- Measured background concentration of 0.6 µg/m^3 (as projected concentrations are not available).

The contribution of ammonia to total nitrogen deposition was calculated using a deposition rate for ammonia of 0.02 m/s, taken from the CERC ADMS-Roads User Guide.

Even with the addition of ammonia as another source of nitrogen within the nitrogen deposition calculations, small rates of deposition are still predicted with a maximum change in deposition rate of 0.2 becoming 0.3 kg N ha^{-1} yr^{-1} at the edge of the road.

Appendix E. Commentary on modelling work undertaken by Air Quality Consultants for Wealden District Council and on Wealden District Council's response to the South Downs National Park Local Plan

AECOM was asked to:

'Produce an appendix to the AQIA to:

a) Explain why your assessment has not relied on the 1000 AADT threshold considered in the Wealden judgment.
b) Set out the key methodological differences between the AQC approach and the AECOM approach;
c) Explain why either i) the methodological differences between AECOM and AQC make no difference to the outcome of the assessment; or ii) the AECOM methodology is preferable. In particular:
d) Explain the evidential basis upon which AECOM has assumed an annual 1% decrease in background deposition rates and explain why that is a scientifically robust assumption notwithstanding historic over-estimates of predicted reductions and notwithstanding the AQC;
e) Explain the relevance of ecological interpretation in assessing the likely significant effects of air pollution on the SAC, and its significance in AECOM's and AQC's assessments
f) Give your expert opinion on whether all or any of the 'scenarios' modelled in the AQC Report are scientifically reasonable and, if so, what is the consequence for the Council's ability to rely on AECOM's conclusion that there are no likely significant adverse effects of planning growth in Tunbridge Wells Borough?
g) Address any miscellaneous points arising out of the representations made by Wealden DC in response to the HRA and/or in relation to planning applications to explain why the criticisms/representations made by Wealden DC are misplaced'.

The below response covers these points and constitutes the requested Appendix.

Point 1(a) – the use of the 1,000 AADT metric

The Wealden vs. Lewes case has undermined the value of the 1,000 AADT metric entirely. There are several fundamental points regarding the 1,000 AADT metric, which we cover below:

1. It was only ever intended as a shorthand method to decide whether it is worth doing actual air quality modelling; the figure of 1,000 AADT has no special air quality significance in itself (other than being widely agreed in the industry that, when translated into air quality modelling, a change of less than 1,000 AADT generally works out to be a change in nitrogen deposition rate so far below any damage threshold that it could be ignored);
2. It was only ever intended to be a first stage in the traffic/air quality assessment process. The core of the assessment process is the air quality modelling which is in any case a more robust way of examining impacts than simply scrutinising AADTs since it allows fleet composition, average vehicle speeds, habitat structure (in broad terms e.g. woodland or grassland), meteorology etc. to be taken into consideration, all of which influence deposition of pollutants.

Therefore, if you have undertaken air quality calculations anyway, the 1,000 AADT metric is irrelevant as its only value is in determining if it is worth performing such calculations. Since the High Court case the main practical change has been the general abandonment of the 1,000 AADT metric: to use it cumulatively requires all the detailed traffic modelling that one would need for the air quality calculations anyway, so one may as well proceed straight to the air quality modelling. This has the advantage of being a much more nuanced assessment than simply summing AADTs (see point 2 above) and is also inherently cumulative/in combination due to the way the models are built.

Points 2(b) to 2(f) – comparison between the AECOM modelling and Air Quality Consultant's modelling

The key differences in modelling approach between the AQC work and AECOM work

The key differences in modelling approach between the AECOM and AQC assessments are:

- Pollutants considered;
  - Both assessments have considered NOx concentrations, ammonia, nitrogen deposition and acid deposition;
  - AQC also considered nitric oxide (NO), nitrogen dioxide (NO_2), particulate ammonium (NH_4^+), airborne reduced nitrogen (NH_x)[2] and particulate nitrate (NO_3^-)[3].
- Air Quality model verification;
  - AQC utilised a single monitoring location for verification for Lewes Downs SAC. This monitoring point was located in a canyon location along the A26 (as described in Lewes Downs SAC Air Quality Assessment, Appendix A2 Modelling Methodology, paragraph A2.3) and was modelled using a canyon module to represent the specific reduced dispersion of pollutants associated with canyon locations and so higher concentrations within canyons. However, AQC did not use the canyon module elsewhere in the modelling indicating that the wider area (i.e. the Lewes Downs SAC under consideration) was not considered to be a canyon. The verification used therefore was optimised to describe pollutant concentrations at the canyon along part of the A26 and not the Lewes Downs SAC and so it is unclear how this will have better represented emissions within the ecosystem);
- Background concentrations;
  - AECOM used Defra background maps;
  - AQC also used Defra background maps but carried out an additional calibration step using national monitoring data uplifting NOx background concentrations by 9.4% (as described in Lewes Downs SAC Air Quality Assessment, Appendix A2 Modelling Methodology, paragraph A2.8). The methodology for derivation of this factor is not provided fully in the document referenced (AQC, 2016, Deriving Background Concentrations of NOx and NO_2 for use with CURED V2A), noting this calibration is based on background sites in the Automatic Urban and Rural Monitoring Network (AURN). However, the method does not indicate whether this calibration is based on all 'urban background' locations, 'suburban background' locations or 'rural background' locations, noting one example of a site at London Hillingdon that has been excluded. A review of Figure 6, (op cit.) suggests that approximately 50 background sites have been used, but that the relationship against the Defra background map is largely good, with a number of outlier points, suggesting that a wider review of sites, such as the review which excluded London Hillingdon had been carried out, may identify that there are other sites that should be excluded or that sites should be better grouped to describe specific types of site (e.g. urban or rural locations). This may then result in a different calibration factor being derived for 2014 for this type of location. It should also be noted that applying this same AQC calibration step to a baseline year of 2015 would result in a reduction of NOx of 0.09%. Therefore, whilst this additional calibration step has been used the factor employed may or may not be appropriate for the Lewes Downs SAC.
  - In those projects where baseline data has been gathered AECOM presents annual averages. Very unusually, AQC have not presented their monitoring data for annual periods, despite this being possible for a large proportion of the data collected so showing normal year to year variations in pollutant

concentrations is possible but not presented. Monitoring data is presented for 2 years of data collection up to the summer of 2016. Therefore, as the report was published in October 2017 three years of data should have been available for consideration. Although, data was installed at a variety of points within the study a large proportion of data is available for 24 months or a large percentage of 24 months. However, curiously data is not presented as annual averages, but as a two year average. Significantly, this prevents the reader from understanding variations between the years of monitoring data as would be expected from annual monitoring surveys.

- Deposition rates;
  - AECOM used deposition rates taken from APIS using a standard fixed deposition velocity (based on DMRB guidance), although sensitivity testing has been undertaken using the higher velocities referenced in the AQC report.
  - AQC used an approach where deposition rates were taken from APIS and using a standard fixed deposition velocity and also a temporally-variable approach to calculating deposition fluxes. Paragraph 7.25 of the AQC report indicates that the modelling method used here involves much higher nitrogen deposition velocities than those used in standard modelling which will partly explain the greater forecast deposition rates that those identified in the AECOM report which uses the standard methods and deposition velocities.
- Future air quality assumptions (NO_x);
  - AECOM typically prepare two scenarios:
    - one assuming all Defra improvements (Emission Factor Toolkit (EFT)); and
    - one with background concentrations and emission rates from approximate midpoint (e.g. 2023 for a 2030 plan) – this second scenario represents reasonable worst case. For the purposes of the modelling of Ashdown Forest only this scenario is reported.
  - AQC presented three scenarios:
    - official predictions using Defra rates of improvement;
    - a sensitivity test using the in-house CURED approach; and
    - no improvements in air quality.
- Future air quality assumptions (nitrogen deposition)
  - AECOM assessments typically assume c.1% reduction per year in background deposition rate, which is half the amount advised in DMRB HA207/07 Annex F and so includes consideration of uncertainty in the rates of reduction over time in nitrogen deposition.
  - AQC prepared an assessment assuming that background nitrogen deposition rates will hold constant at the average 2013-2015 value, on the basis that there is a non-linear relationship between NOx emissions and N-deposition rates.

The AQC modelling includes 24-hour NOx (known as the short-term critical level). The ecological value of the 24hr NOx metric is limited The WHO (2000) guidelines include a short-term (24 hour average) NOx critical level of 75 µg/m^3. Originally set at 200 µg/m^3, the guideline was considerably lowered in 2000 to reflect the fact that, globally, short-term episodes of elevated NOx concentrations are often combined with elevated concentrations of O_3 or SO_2, which can cause effects to be observed at lower NOx concentrations. However, high concentrations of O_3 and SO_2 are rarely recorded in the UK. As such, there is reason to conclude that in the UK the short-term NOx concentration mean is not especially ecologically useful as a threshold. The Centre for Ecology & Hydrology have commented that '*UN/ECE Working Group on Effects strongly recommended the use of the annual mean value, as the long-term effects of NOx are thought to be more significant than the short-term effects*'[44].

[44] Sutton MA, Howard CM, Erisman JW, Billen G, Bleeker A, Grennfelt P, van Grinsven H, Grizzetti B. 2013. The European Nitrogen Assessment: Sources, Effects and Policy Perspectives. Page 414. Cambridge University Press. 664pp. ISBN-10: 1107006120
June 2011. Manual on Methodologies and Criteria for Modelling and Mapping Critical Loads & Levels and Air Pollution Effects, Risks and Trends. Chapter 3: Mapping Critical Levels for Vegetation

The AECOM report models all receptors as if they represented the 'ideal' habitat (heathland). In contrast, the AQC report models the habitats that are actually currently present. For the most affected areas this is woodland. However, woodland is not an SAC feature, so effects of the woodland are not relevant to consideration of impacts on the ability of the SAC to achieve its conservation objectives (the primary requirement of the HRA process). Woodland has a higher deposition flux than heathland; for this reason (and because of the use of higher deposition velocities as already mentioned) the modelled nitrogen deposition rates reported are often higher than in the AECOM model.

Why the AECOM approach is preferable

The AQC approach presents four unrealistically conservative scenarios and two that we consider unrealistically optimistic. The most realistic scenarios presented by AQC (Scenarios 3 and 5) apply some conservatism to future emissions from diesel vehicles but assume all other future improvements occur as currently anticipated by Government, which is likely to present a too optimistic picture.

In contrast, the approach to future rates of deposition in the less realistic scenarios are very conservative, assuming no change in background deposition rates despite noting within their report that since 1988 total nitrogen deposition has reduced by 13%, illustrating the presence of an existing improving trend. The deposition rate calculations undertaken by AQC utilising a temporally variable approach is not based on guidance and it is unclear exactly how the variable values were calculated.

It is considered by AECOM, and also stated in paragraph 7.33 of the AQC report, that the future situation is most likely to be somewhere between the scenarios presented in the AQC report (paragraph 7.33 *"Overall, the future-year deposition projections will have a level of uncertainty associated with them, but it is not unreasonable to expect the reality to lie somewhere between the different scenarios that have been modelled."*) i.e. somewhat less optimistic than AQC Scenarios 3 and 5 but considerably better than the other AQC Scenarios.

AECOM's modelled scenario falls into this middle ground. The AECOM approach is based on published methods and guidance documents, (e.g. Defra and DMRB), with conservative assumptions made where appropriate (e.g. partial future improvements in concentrations, emissions and deposition rates). The AECOM approach predicts a scientifically reasonable realistic worst case assessment of future air quality and deposition, rather than a range of overly conservative or optimistic predictions. For example, with regard to nitrogen deposition the AQC report produced for Ashdown Forest SAC states in paragraph 3.10 that since 1988, the total deposition of nitrogen has decreased by 13%. Paragraph 7.30 of the same report states that oxidised nitrogen deposition decreased by 14% between 1988 and 2010. This is an improvement of 0.59% (total nitrogen) or 0.64% (oxidised nitrogen) per annum on average. The AECOM modelling assumes a modest improvement in background nitrogen deposition from 2017 to 2033 equivalent to 0.75% per annum on average. This is not a substantive difference from past trends, and as new vehicles (i.e. Euro 6/VI) with reduced emissions replace older vehicles in the vehicle fleet it makes sense to allow for a slightly increased average rate of improvement in the future. This can be seen in the real world emission tests reported in the Department for Transport Vehicle Emissions Testing Programme (2016) which shows that under real world driving conditions Euro 6 emissions are on average lower than the older Euro 5 standard.

The AQC study uses a bespoke modelling method for nitrogen deposition. They relate it to an Environment Agency study published in 2008 (paragraph 7.22). However, paragraph 7.24 of the AQC report acknowledges that one of the drawbacks of the bespoke 'first principles' method is that '… *some of the parameters used in the deposition model are highly uncertain*' and that small variations in some, such as stomatal resistance, could have quite large effects on the resulting deposition fluxes. All forecasting methods have their benefits and drawbacks and one risk of using an extremely complex model is that there is more room for uncertainties to affect the results due to the greater number of uncertain parameters in the model.

Whether any or all of the AQC 'scenarios' represent a scientifically 'reasonable' approach

Seven scenarios have been considered within the AQC report:

- Scenario 1 is a scientifically reasonable representation of current baseline but only represents the baseline rather than any forecasting.

- Scenarios 2 (without the Wealden Local Plan) and 4 (with the Wealden Local Plan) postulate future (2028) scenarios assuming **no** improvements in any rates (emissions, deposition), backgrounds etc. Since they assume no improvement whatsoever (and thus a reversal of long-established trends), these are considered to be an unrealistically pessimistic assessment of the future situation and thus not scientifically reasonable. Even the AQC Ashdown Forest and Lewes Downs reports acknowledge as much. The AQC Ashdown Forest report states (in paragraph 7.11) that '*It is considered that, with respect to vehicular NOx emissions, Scenarios 3 and 5 provide a reasonable worst-case assessment, while Scenarios 2, 4, 6, and 7 provide an extreme worst-case upper-bound'.* In the Lewes Downs report AQC state that '*The results from the sensitivity test and worst-case scenario are likely to over-predict emissions from vehicles in the future*'.

- Scenarios 3 (without the Wealden Local Plan) and 5 (with the Wealden Local Plan) represent the future (2028) scenarios assuming that projected DMRB/Defra improvements in rates (emissions, deposition), backgrounds etc. are **fully** realised. AQC's assessment utilises their bespoke CURED tool to apply a more pessimistic view of improvements in diesel emissions for the future scenario than the published Defra emission rates. This is therefore likely to contain a more reasonable assessment of future emissions than other scenarios assessed; however as only one parameter has been adjusted to account for reduced optimism in future emission rates, whilst assuming full projected improvements in deposition rates and background concentrations, it is likely that these scenarios will present an unrealistically optimistic assessment of the future situation.

- Scenarios 6 (without the Wealden Local Plan) and 7 (with the Wealden Local Plan) postulate the future (2028) scenarios assuming emissions per vehicle, primary NO_2 proportions, and rural background ozone concentrations remain at 2015 values (i.e. no improvement), but with HNO_3, particulate deposition, and wet deposition projected to 2028. These scenarios are also considered to be unrealistically pessimistic and thus scientifically unreasonable, for the same reasons as Scenarios 2 and 4.

In AECOM's view the most scientifically reasonable scenario(s) that AQC have postulated are Scenario 3/5 (although we nonetheless consider them to be excessively optimistic in their assumptions of improvements in background emissions and deposition rates). These are the scenarios that mirror the trends the AECOM analysis has forecast:

- With regard to 'in combination' trends in NOx concentrations, paragraphs 10.55 and 10.56 of the AQC report state that: '***Predicted annual mean NOx concentrations in 2028 with the Local Plan are, in this emissions scenario*** [Scenario 5]***, lower than those at present.*** *This is because the predicted changes in emissions from the average road vehicle more than offset the increases in traffic that are predicted over the same period. Over most of the SAC, the predicted reductions in NOx concentrations are less than 4 µg/m^3, but close to roads the reductions are greater, with changes* [reductions] *greater than 8 µg/m^3 predicted alongside many of the roads'*.

- With regard to trends in nitrogen deposition rates, paragraph 10.72 of the AQC report states that '*Increases* [in nitrogen deposition due to the Wealden Local Plan] *greater than 0.05 kg-N/ha/yr are predicted in the vicinity of roads, but extend out up to almost 300 m from the A22 and 100 m from the B2026.* ***Increases greater than 1 kg-N/ha/yr*** [due to the Wealden Local Plan] ***are predicted close to the A22'.*** However, when moving to the 'in combination' discussion, paragraph 10.77 makes it clear that these 'increases' are considerably more than offset by a forecast large net reduction in nitrogen deposition. Paragraph 10.77 says: *'For the reasons explained for NOx concentrations, nitrogen deposition is predicted to reduce across the entire SAC in this scenario comparison. The minimum reduction is 0.8 kg-N/ha/yr, which is predicted to occur at background locations to short vegetation.* ***The maximum reduction is 14 kg-N/ha/yr, which is predicted to occur to woodland alongside the A22.*** *The reductions are higher where the baseline fluxes are highest (i.e. over woodland and close to roads) because this is where the anticipated reductions in NOx emissions per vehicle are predicted to have the greatest effect'.*

Whether the results of that scientifically reasonable approach are ecologically significant and why

The overall trends and relationships in AQC Scenarios 3/5 (the only scenario(s) we consider broadly reasonable) are similar to the trends and relationships that AECOM has forecast, notwithstanding the very different modelling methods.

The forecast contribution of future traffic to nitrogen deposition is considerably greater in the AQC model (more than 1 kgN/ha/yr at the roadside of the A22 at Wych Cross) than in the AECOM model (0.31 kgN/ha/yr at the same location). Similarly, AQCs forecast net improvement in nitrogen deposition (a reduction of 14 kgN/ha/yr adjacent to the A22 at Wych Cross) is much greater than that forecast by AECOM (a reduction of 1.89 kgN/ha/yr forecast for the same location). However, these differences are likely due to a combination of the different habitats modelled (woodland in the AQC work, heathland in the AECOM work), the very different deposition modelling methods used and (regarding improvements in background) the fact that AQC postulate a percentage improvement in deposition (23%) that is nearly double that in the AECOM model (12%) and apply this to a higher baseline deposition rate (60 kgN/ha/yr adjacent to the A22 at Wych Cross according to paragraph 9.19 of the AQC report, compared to 15kgN/ha/yr at the same location in the AECOM model)[45].

The actual rates and concentrations are thus different between the two models, **but** the ecological interpretation of Scenarios 3/5 of the AQC modelling would mirror that of the AECOM scenario. A significant net improvement in nitrogen deposition is forecast even allowing for future growth and the forecast nitrogen contribution of that 'in combination' growth is not only more than offset by the expected improvement (which is expected to be an order of magnitude greater than the contribution of the additional traffic) but is unlikely to result in a measurable retardation in any heathland vegetation recovery/establishment that might otherwise occur. For example, Table 21 of NECR2010 records that at baseline deposition rates of 30kgN/ha/yr (the highest deposition rate cited in that report) a reduction in species richness equivalent to '1' (i.e. a reduction in the frequency with which at least 1 species was encountered in a given sample quadrat) was associated in heathland with a dose (incremental increase) of 2.4kgN/ha/yr. While no areas with deposition rates as high as 60kgN/ha/yr were covered by the analyses in NECR2010 it is reasonable to conclude that the documented trend (i.e. an ever larger dose of nitrogen required to achieve the same negative effect as baseline deposition rates rise) will continue or level off at deposition rates above 30 kgN/ha/yr. Southon et al (2013) studied over fifty heathlands across England at deposition rates of up to 32.4kgN/ha/yr and found that above 20 kgN/ha/yr *'… declines in species richness plateaued, indicating a reduction in sensitivity as N loading increased'.*

In the Statement of Common Ground being drawn up between the various authorities surrounding Ashdown Forest, Wealden District Council has argued that Natural England Research Report NECR2010 is not applicable to Ashdown Forest on the basis that:

- The report did not include Ashdown Forest itself in its sample and thus did not include the influence of local conditions at that site, including the current condition of the heathland;
- There was limited coverage of heathland sites located in the south-east of England; and
- The analysis did not include wet heath.

In fact, the heathland sites covered by the research reported in NECR2010 had a wide geographic spread and were subject to a range of different 'conditions' but the identified trends were nonetheless observable. The fact that a given heathland site may not have been included in the sample cannot be a basis for the identified trend to be dismissed as inapplicable. On the contrary, the value of the available dose-response research is precisely in the fact that it covers a geographic range of sites subject to a mixture of different influences that might otherwise mask the nitrogen relationships if a given site was looked at in isolation. NECR2010 illustrates that consistent trends have been identified *despite* the differing geographic locations of those habitats and different conditions at the sites involved.

Heathland and acid grassland (a related habitat that is often found intermixed with heathland) have been particularly well studied across broad geographical, climatic and pollution gradients covering different levels of soil organic matter, rates of nutrient cycling, plant species assemblages and management regimes. Despite this, the overall trends, including that a given 'dose' of nitrogen generally has less effect on a range of vegetation parameters as background deposition rates rise

[45] This difference in baseline rates is because the AECOM model uses Defra modelled baseline data and models heathland at this location, while AQC uses local measured data and models woodland at this location.

has been reported by various peer reviewed academic papers[46]. Southon et al (2013) surveyed 52 heathlands across England and observed statistically significant trends despite the large differences in conditions of these heathlands. That paper specifically states that '*the biggest reductions in species number* [were] *associated with increasing N inputs at the low end of the deposition range'* and that '*The similarity of relationships between upland and lowland environments, across broad spatial and climatic gradients, highlights the ubiquity of relationships with N*'.

Based on the consistent trend across the range of habitats studied (including wet habitats such as bogs as well as lowland heathland, upland heathland and dune systems) there is no basis to assume that the identified trends would not be applicable to all types of heath, including wet heath. Upland heathlands tend to be wetter than lowland heathlands due to climate differences and yet the same pattern has been observed as reported in Southon et al (2013).

Due to the existence of other influences (such as management) that have a much greater effect on relevant vegetation parameters than does nitrogen deposition, there can be no absolute certainty that the reported trends would be observed in a given part of Ashdown Forest. However, there is a reasonable scientific expectation that the observed relationships would be detected if Ashdown Forest was included in the broader sample.

Point 2(g) – g) Address any miscellaneous points arising out of the representations made by Wealden DC in response to the HRA

AECOM is aware that Wealden District Council submitted a response to the South Downs National Park Local Plan consultation which made a number of criticisms of AECOM's original modelling work undertaken in summer 2017. We respond to the relevant points below.

Complaint 1: Failure to take account in the Lewes Downs SAC modelling of additional Wealden growth identified since 2015

Although proposed growth in Wealden District has changed since the modelling was undertaken, the trends and magnitudes depicted in the modelling are such that they would not be reversed by the additional housing being delivered in surrounding authorities:

- For both modelled roads, comparison of the DS scenario with the Base case forecasts NOx concentrations and nitrogen deposition rates to reduce over the period to 2030. Incorporating additional growth in Wealden District beyond that modelled in 2015 would be highly unlikely to reverse the modelled improving trend in either nitrogen deposition or NOx concentrations as the forecast improvement far exceeds the probable retardation due to additional traffic.
- Moreover, Lewes District/South Downs National Park would still only be responsible for mitigating their contribution to any 'in combination' change in air quality. For both roads the forecast contribution of the South Downs Local Plan to nitrogen deposition is virtually zero even at the closest point to the road. A change of this magnitude, whilst capable of being calculated, would not be capable of having a material effect on the SAC.

Complaint 2: Failure to take account of growth that has already been delivered prior to 2017 in the Ashdown Forest modelling

(2010). Nitrogen deposition threatens species richness of grasslands across Europe. Environmental Pollution, 158(9), pp. 2940–2945.

The model does include traffic already on the network, and thus includes the role of development completed prior to 2017. The 'Do Something' 2033 air quality forecast includes existing NOx concentrations and nitrogen deposition (and thus the projects/plans that will have contributed to them). Doing so illustrates that, even including both the existing traffic and further emissions/deposition due to additional traffic, there is forecast to be a net improvement in air quality by 2033 due to projected improvements in those background concentrations/rates and vehicle emission factors.

Complaint 3: Suggestion that the area affected by exhaust emissions can extend beyond 200m

In all cases our modelled transects show that NOx concentrations and nitrogen deposition rates are forecast to fall to background levels well before 200m from the roadside. In any event the greatest impact will always be recorded closest to the road and using this roadside data will provide the most precautionary assessment. Therefore there is no value in extending transects any further.

Complaint 4: Failure to take account of uncertainty regarding improvements in emissions and deposition

The specific comment made by Wealden was as follows: '*There is uncertainty with regards to projected future vehicle emissions of NOx and this alone would mean that a precautionary approach should be used within the HRA. If there is a decrease in NOx concentrations from vehicles, the interaction between NOx and nitrogen deposition has not been considered as well as the role of ammonia in this regard. This is a particular issue as the levels of emissions of ammonia from vehicles in the future is unknown, is not currently regulated, and there is a potential for emissions to increase. This provides an added reason for the need to apply the precautionary principle when considering the impact of emissions. In this regard the HRA is considered to be incomplete*.'

The appropriate use of the precautionary principle is not simply to assume that the worst outcome conceivable is the one that will happen. It also involves making a balanced judgment based on past trends and the likelihood of those trends continuing or increasing. There is a long history of improving trends in key pollutants (notably NOx) and in nitrogen deposition rates, and there is no reason to expect that will suddenly cease; on the contrary, as new vehicles (i.e. Euro 6/VI) with reduced emissions replace older vehicles in the vehicle fleet it makes sense to allow for a slightly increased average rate of improvement in the future. This can be seen in the real world emission tests reported in the Department for Transport Vehicle Emissions Testing Programme (2016) which shows that under real world driving conditions Euro 6 emissions are on average lower than the older Euro 5 standard. AECOM has therefore made a precautionary allowance for improvements in background NOx concentrations. On the other hand, in our ammonia modelling no allowance has been made for improvement in background concentrations.

With regard to nitrogen deposition the AQC report produced for Ashdown Forest SAC states in paragraph 3.10 that total nitrogen deposition (i.e. taking account of both reduced and oxidised nitrogen) decreased by 13% between 1988 and 2010. This is an improvement of 0.59% (total nitrogen) per annum on average. The AECOM modelling assumes an improvement in background nitrogen deposition from 2017 to 2033 equivalent to 0.75% per annum on average. This is not a substantive difference, and given the introduction of new vehicles with reduced emissions (as described above) it makes sense to allow for a slightly increased average rate of improvement in the future. The AECOM assessment presents a realistic worst-case that is considerably more cautious than those advocated in the only available Government guidance on the issue (Defra concerning NOx rates of improvement and DMRB concerning rates of N-deposition improvements).

While the AQC reports produced for Wealden District Council include numerous scenarios that assume no improvement in background emissions and deposition rates (and thus a net deterioration in both), we note that AQC themselves do not consider those scenarios to be realistic. The AQC Ashdown Forest report states in paragraph 7.11 that *'It is considered that, with respect to vehicular NOx emissions, Scenarios 3 and 5* [which make significant allowances for improvement in NOx concentrations and background nitrogen deposition rates] *provide a* ***reasonable*** [emphasis added] *worst-case assessment, while Scenarios 2, 4, 6, and 7* [which make no allowance for improvement in background] *provide an* ***extreme*** [emphasis added] *worst-case upper-bound*'. An 'extreme' case, while not impossible, is unreasonable and unrealistic almost by definition. Similarly, in the Lewes Downs report AQC state that *'The results from the sensitivity test and worst-case scenario are likely to over-predict emissions from vehicles in the future'*. AECOM agrees with the statement in paragraph 7.33 of the AQC Ashdown Forest report that '*Overall, the future-year deposition projections will have a level of uncertainty associated with them, but it is not unreasonable to expect the reality to lie somewhere between*

the different scenarios that have been modelled.' i.e. somewhat less optimistic than AQC Scenarios 3 and 5 but considerably better than the other AQC Scenarios. AECOM's modelled scenario falls into this middle ground.

Complaint 5: '*The modelling only considers the base date and one date in the future (last year of the Plan period). By assuming that there is a reduction by the end of the plan period it cannot take into account the potential damage caused by the emissions at the higher level (earlier in the plan period)'*.
Appendix C of AECOM's updated modelling report contains an analysis of intervening years between 2017 and 2033 to confirm that year-on-year net improvement in emissions is expected. Moreover, for vegetation, long-term trends in air quality are more important than short-term fluctuations. The ecological effects of nitrogen deposition are most associated with persistent long-term exposure (i.e. many years). Whether growth will result (for example) in an increase in nitrogen deposition for a couple of years before improvements in emission factors and background rates 'catch up' would be less important than whether there will be a persistent net increase or decrease in deposition over the plan period.

Complaint 6: Failure to account for ammonia emissions
AECOM's modelling has been updated to account for ammonia emissions. Due to the aforementioned uncertainties no allowance for improvement in background ammonia concentrations has been factored into AECOM's modelling.

Complaint 7: Failure to consider air quality impacts on Pevensey Levels SAC
The Pevensey Levels SAC is designated for its population of Ramshorn Snail (*Anisus vorticulus*). Provided the water is unpolluted and has a fairly diverse flora (without much emergent vegetation e.g. reeds) this species doesn't have very precise habitat structure or botanical requirements.

While eutrophication (excessive vegetation growth from nutrient enrichment) is a risk, the ditches of the Pevensey Levels (like most freshwater bodies) are understood to be 'phosphate-limited', meaning that phosphate is the most important nutrient to control. Phosphate does not derive from atmosphere but does come in large volumes from agricultural runoff and treated sewage effluent. Provided phosphate levels can be controlled then nitrogen inputs (even through the water column) are unlikely to have a material effect on plant growth/habitat structure in the ditches. This is why, in most freshwater SACs, the attention is focussed on controlling phosphate inputs rather than nitrogen inputs.
In any case, since there are no applicable critical loads or NOx critical levels for the interest features of this SAC there are no appropriate reference levels/damage thresholds for any impact assessment. It is also noted that the Site Improvement Plan produced by Natural England does not mention air quality as a concern and we understand from personal communication from Natural England officers that they do not currently see atmospheric nitrogen deposition as a risk to the integrity of this site.

Complaint 8: Suggestion that the model/scenarios in the AQC report are 'better' than the standard method
The AQC studies use a bespoke modelling method for nitrogen deposition that goes back to first principles (such as stomatal resistance), but is related to an Environment Agency study published in 2008 (paragraph 7.22). The fact that a given model is more detailed or elaborate does not necessarily mean it is any more likely to accurately forecast local air quality by 2033 because there is a need to make judgment-based decisions over parameters and future trends that may or may not be correct whatever model is used. One risk of using a complex model is its inherent complexity: there are a large number of parameters in the model and greatly varying levels of certainty in those parameters. Paragraph 7.24 of the AQC report acknowledges this where it states that '… *some of the parameters used in the deposition model are highly uncertain*' and notes that small variations in some, such as stomatal resistance, could have quite large effects on the resulting deposition fluxes. This doesn't mean that such a model shouldn't be used if desired but given the uncertainties in any forecasting it is at least equally defensible to follow the existing simpler method that is deployed as standard good practice and supported by Natural England. While there are uncertainties in (for example) the relationship between NOx concentrations and nitrogen deposition these must be addressed whatever model is used and the improvements in nitrogen deposition rate included in the AECOM modelling are in line with recorded trends, as identified earlier in this note.

The Wealden studies prepared by AQC have modelled a range of scenarios which differ greatly in their outcomes for the same traffic data, ranging from predicting a large net increase in nitrogen deposition to predicting a large net reduction. AQC acknowledge in their reports that most of their modelled scenarios are unrealistic. The scenario that AQC themselves

identify as being most realistic (Scenarios 3 and 5 in the Ashdown Forest report) broadly correspond with the AECOM modelling, notwithstanding the considerable difference in methodological details. It forecasts additional nitrogen deposition due to additional traffic but predicts that this will be more than offset by improvements in background and emission factors, leading to a large net reduction in nitrogen deposition. Indeed, the allowances made in the AECOM modelling for improvements in background rates/concentrations and emission factors are actually more conservative than those in AQC scenarios 3 and 5.

Complaint 9: It is considered that Plans that allocate sites, and propose that these sites are deliverable, should have a greater level of assessment than a strategic plan which does not distribute growth to certain areas

For Ashdown Forest we have modelled growth across South Downs and Lewes District in detail (i.e. using information on site allocations). Although the modelling for Lewes Downs SAC was undertaken in 2015 and thus did not include the smaller site allocations in the centre and west of the National Park, it did include the key strategic ones around Lewes as they were in the Joint Core Strategy and the quantum and distribution of growth in the areas of the National Park most likely to affect flows on the SAC (i.e. around Lewes town) have not materially changed since that time.

Appendix F. Existing or Proposed Sustainable Transport Policies

Core Policy 13 – Sustainable Travel

The local planning authority will promote and support development that encourages travel by walking, cycling and public transport, and reduces the proportion of journeys made by car, in order to help achieve a rebalancing of transport in favour of sustainable modes by:

1. **Ensuring that new development is located in sustainable locations with good access to schools, shops, jobs and other key services by walking, cycling and public transport in order to reduce the need to travel by car (unless there is an overriding need for the development in a less accessible location).**

2. **Ensuring that the design and layout of new development prioritises the needs of pedestrians, cyclists and users of public transport over ease of access by the motorist.**

3. **Ensuring that new residential developments are designed to achieve speeds of 20 mph or less.**

4. **Ensuring that new development minimises the need to travel and incorporates appropriate measures to mitigate for any transport impacts which may arise from that development.**

5. **Requiring new development to provide for an appropriate level of cycle and car parking in accordance with parking guidance approved by the local planning authority.**

6. **Requiring development which generates a significant demand for travel, and/or is likely to have other transport implications to:**

   i. **Be supported by a Transport Assessment/Transport Statement and sustainable Travel Plan, where appropriate;**

ii. Contribute to improved sustainable transport infrastructure, including the provision of safe and reliable sustainable transport modes; and
iii. Provide facilities and measures to support sustainable travel modes.

The local planning authority will work with East Sussex County Council and other relevant agencies to encourage and support measures that promote improved accessibility, create safer roads, reduce the environmental impact of traffic movements, enhance the pedestrian environment, or facilitate highway improvements. In particular, the local planning authority will:

a. Support the expansion and improvement of public transport services, particularly those providing links between the rural and urban areas;
b. Encourage improvements to existing rail services, new or enhanced connections or interchanges between bus and rail services, and improvements to the quality and quantity of car and cycle parking at railway stations; and
c. Support the development of a network of high quality walking and cycling routes throughout the district.

South Downs Local Plan Policy SD19: Transport and Accessibility (not yet adopted)

1. Development proposals will be permitted provided that they are located and designed to minimise the need to travel or promote the use of sustainable modes of transport.

2. Development proposals that are likely to generate a significant number of journeys, especially of vehicles, must be located near existing town and village centres, public transport routes, the cycle network and main roads. Such developments will be required to provide a transport assessment or transport statement.

3. Development proposals must demonstrate the continued safe and efficient operation of the strategic and local road networks.

4. The following improvements to public transport infrastructure will be supported:

a) Public transport waiting facilities, particularly those with reliable and accessible information;

b) Infrastructure supporting the transfer of freight from road to rail and water;

c) Improvements to walking, cycling and bus connectivity at all transport interchanges;

d) Improvements to the quality and provision of cycle parking at railway stations and key bus stops.

5. In town and village centres, development will be permitted which appropriately provides for improved footways and cycle routes, cycle parking, and measures to restrict the impact of heavy goods vehicles and other traffic on historic streets.

6. Development proposals for powered aircraft landing or operation sites, or the expansion or intensification of such uses, will be refused. If exceptional circumstances exist which indicate that such development proposals are necessary, these will only be permitted where the impacts on both the special qualities, and on local amenity, can be fully mitigated.

About AECOM

AECOM (NYSE: ACM) is a global provider of professional technical and management support services to a broad range of markets, including transportation, facilities, environmental, energy, water and government. With approximately 100,000 employees around the world, AECOM is a leader in all of the key markets that it serves. AECOM provides a blend of global reach, local knowledge, innovation, and collaborative technical excellence in delivering solutions that enhance and sustain the world's built, natural, and social environments. A Fortune 500 company, AECOM serves clients in more than 100 countries and has annual revenue in excess of $6 billion.

More information on AECOM and its services can be found at www.aecom.com.
