

ComPOOst

Solutions

You are using a compost toilet from Compoost Solutions

What?

Compost toilets are a chemical free, water free, renewable alternative to normal flushing or chemical event toilets.

Why?

The chemicals in normal event toilets, whilst masking some smells, kill all the natural bacteria in the waste that allows it to breakdown and decompose naturally. The solid waste in these toilets can be composted and then returned to the land as a natural fertiliser once it has broken down sufficiently. These toilets allow the smelly liquid waste to filter off which means we can reduce odour without the need for chemicals. It also means the solid waste left over makes a better compost. The lights are 100% solar powered too.

How?

To aid the compost process we ask you to use the rule – ‘1 Poop, 1 Scoop’ meaning, please use sawdust for a poop, but there is no need to use any for a wee. Aside from helping the compost to eventually break down, the sawdust also helps cover up what you have left for the next user and helps reduce odour. Please refrain from dropping litter or nappies in the toilet. Sanitary products are acceptable.
